NATIONAL HEAT WIND PLAN 2017

PREAMBLE

The National Heatwave Plan (PNC) is the result of work developed jointly by representatives of the central administration departments (General Directorate of Health (DGS), General Directorate of Healthcare Supply (DGOS), General Directorate of Social Cohesion (DGCS), General Directorate of Labor (DGT), General Directorate of Civil Security and Crisis Management (DGSCGC), Delegation for Information and COMMunication (DICOM), Regional Health Agencies (ARS Center , ARS Rhône-Alpes) and other organizations such as the National Public Health Agency (ANSP) and Météo-France.

This plan was presented for opinion on April 20, 2017 to the Monitoring and Evaluation Committee of the National Heatwave Plan and the national guide for the prevention and management of health and social impacts linked to cold waves (CSEP).

It was then presented for validation to the National Steering Council (CNP) of the ARS xx xx 2017 and to the collegial steering body for social cohesion (COMEX) xx xx 2017.

LIST OF ACRONYMS

ANACT:	National Agency for the Improvement of Working Conditions
ADF:	Assembly of Departments of France
AMF:	Association of Mayors of France
ANSES:	National Agency for Health, Food, Environment and Labor Safety
ANSM:	National Agency for the Safety of Medicines and Health Products
ANSP	National Public Health Agency ¹
ARS:	Regional Health Agency
ASN:	Nuclear Safety Authority
BQA:	Daily Alert Bulletin
CARSAT:	Retirement and Occupational Health Insurance Fund
CCAS:	Municipal Social Action Center
CDC:	Departmental Heatwave Committee
CIC:	Interministerial Crisis Unit
WAX:	Regional Intervention Unit

NATIONAL HEAT WIND PLAN 2017

I. THE NATIONAL HEAT WIND PLAN : AN EVOLVING MANAGEMENT

1. History of heatwave episodes since 2003

The exceptional heatwave of the summer of 2003 caused excess mortality in France estimated at nearly 15,000 deaths. France had never been faced with such health consequences caused by a heatwave. This event revealed the need to adapt the national prevention and care system to the occurrence of this type of climatic phenomenon by developing a National Heatwave Plan (PNC) in 2004 which was then updated each year and revised in 2013, to allow in particular a better match between the levels of meteorological vigilance and the levels of the plan.

In July 2006, France experienced another significant heatwave episode, although less intense than in 2003. A study carried out jointly by the Institut de Veille Sanitaire (InVS) and the National Institute of Health and medical research (Inserm) showed that the excess mortality attributable to the heatwave of 2006 was three times less than what was predicted by the temperature-mortality model, based on data prior to 2003.

During the summer of 2015, mainland France experienced several episodes of heatwave, including a very intense one from June 29 to July 7, the earliest since the implementation of the PNC, with significant health consequences and excess mortality of 3300 people. The feedback established following the summer season made it possible to show the strong mobilization and fluid collaboration between the actors implementing the heatwave plan but it also highlighted the need to strengthen the implementation of the PNC to reduce the impact of the heatwave.

The 2016 summer weather season was particularly active with the occurrence of five heat waves from July to mid-September 2016 (yellow and orange levels). The particularly high temperatures in September (+3°C on average in France) led to the maintenance of heatwave vigilance systems until September 15.

In addition, morbidity indicators show that there is an impact on healthcare use observed with increasing temperatures, in all age groups.

Adults aged 15-74 were also affected by these two heatwave episodes and it appears relevant to adapt prevention messages according to age.

In terms of mortality, 700 excess deaths were observed in the July 2016 episode.

However, the late heatwave episodes with temperature records broken at the end of August 2016 are not accompanied by any particular health impact. A health impact has been observed in regions with at least one department on yellow alert, which shows the usefulness of yellow alert on better information and the application of preventive measures, in particular for the most vulnerable people.

2. The objectives of the 2017 National Heatwave Plan

The 2017 PNC aims to anticipate the arrival of a heatwave, to define the actions to be implemented at local and national levels to prevent and limit the health effects of these and to best adapt the control measures. prevention and management at the territorial level, paying particular attention to the specific populations identified.

II. THE STRATEGIC AREAS OF THE PLAN

The plan is organized around four main axes broken down into measures in the form of sheets (appendix):

NATIONAL HEAT WIND PLAN 2017

- Axis 1: Prevent the effects of a heatwave
- Axis 2: Protect populations by implementing management measures adapted to meteorological vigilance levels
- Axis 3: Inform and communicate
- Axis 4: Capitalize on experiences

1. Axis 1: Prevent the effects of a heatwave

The prevention system consists of preventing and anticipating the effects of a possible heatwave in a manner adapted to the different categories of populations identified and in particular for certain people at risk: - for isolated and vulnerable populations, it

is appropriate to ensure that implementing actions to identify these people, coordinate and mobilize services and associations that interact with these populations for better solidarity in the territory; - for people in precarious situations and without a home, it is particularly important to ensure the availability of accommodation

and day care places, the mobilization of mobile teams or any other social monitoring system deemed useful; - for young children, managers of children's structures should be reminded of the recommendations for actions necessary to ensure the refreshment of children and infants;

- for workers, it is necessary to ensure the implementation of measures to limit the effects of heatwave episodes on the conditions for carrying out tasks; - for people at risk in establishments, medico-social establishments must ensure the implementation of blue plans, refreshed rooms and the provision of Emergency Liaison Files (DLU). Health establishments must, for their part, ensure the organization and permanence of care; - for the general public, it is a question of recalling the health consequences of a heatwave for

raise awareness and protect the population through communication actions.

Measure sheets to consult: Sheet 1: communication, Sheet 2: isolated people, Sheet 3: people in precarious situations and homeless, Sheet 4: young children, Sheet 5: workers, Sheet 6: health and medico-social establishments

The "heatwave" health recommendations issued by the High Council of Public Health (HCSP) in 2014 have a dual purpose, therapeutic care and the implementation of preventive actions in order to prepare the population and limit the health impact heatwave episodes. This involves alerting the entire population and triggering an appropriate solidarity movement in the face of a collective threat.

These recommendations are written in the form of directly usable and adaptable sheets. These sheets target the general public but also workers, athletes and their entourage, vulnerable people (children, elderly people, people suffering from chronic illnesses, etc.) as well as professionals (doctors, pharmacists, hospital management staff). establishments for the elderly, directors and staff of establishments welcoming young children, etc.). They can be consulted directly on the [HCSP website](#) and used as necessary by all stakeholders concerned.

NATIONAL HEAT WIND PLAN 2017

2. Axis 2: Protect populations by implementing management measures adapted to weather alert levels

• Indicators

Meteorological vigilance is materialized by a map of mainland France updated at least twice a day (at 6 a.m. and 4 p.m.). This vigilance is broken down by department. The four color levels reflect the intensity of the heatwave risk to which the population will be exposed for the next 24 hours: green, yellow, orange and red. The definition of the different levels of the PNC refers to these four colors of meteorological vigilance.

The vigilance procedure also integrates the expertise of the Heatwave and Health Alert System (SACS). This system was developed from a frequency analysis of thirty years of daily mortality data and various meteorological indicators.

This analysis made it possible to identify the Bio Meteorological Indicators (BMI), which are the averages over three consecutive days (the IBM of day D is the average of D, D+1, and D+2) of minimum temperatures (IBM min) and maximum (IBM max) as being the most relevant for identifying heatwave episodes in mainland France. Departmental alert thresholds have been defined for these two indicators and are reassessed regularly.

A high probability of simultaneously reaching or exceeding the thresholds by the IBM min and max for a given department constitutes the basic criterion for forecasting a heatwave.

This information is supplemented by the analysis of more qualitative indicators (intensity and duration of the heat wave, air humidity) and the expertise of Météo-France.

• Players

The ANSP, as part of the monitoring and alert network and in the event of a switch to orange or red heatwave vigilance by Météo-France, monitors health indicators at local and national levels for seeking care and mortality. The analysis of these health indicators contributes to the sizing of prevention measures and the lifting of the alert as well as the first estimates of the health impact of a heatwave episode.

The Regional Health Agencies (ARS), for their part, transmit information relating to the state to the Operational Center for Regulation and Response to Health and Social Emergencies (CORRUSS) of the General Directorate of Health (DGS) on a weekly basis. of the provision of care in health establishments and the possible identification of tension phenomena.

Upon transition to level 3 – heatwave alert, triggered by the prefect, the ARS must provide daily information on the “heatwave” survey via the Health Information System for Alerts and Crises (SISAC).

Measure sheets to consult: Sheet 1: communication, Sheet 7: general principles of vigilance and heatwave alert, Sheet 10: level 3 - heatwave alert; Sheet 12: departmental version of the PNC

• The cabin crew

The PNC is implemented from June 1 until August 31 of the same year.

For any meteorological situation that justifies it, the PNC is activated outside these periods.

NATIONAL HEAT WIND PLAN 2017

The different levels of the PNC are linked to the four colors of meteorological vigilance. The associated management measures appear in the measurement sheets in the appendix. These are not exhaustive and must be adapted to local contexts. Stakeholders will be able to rely on the 2014 recommendations of the HCSP.

The PNC is implemented in the departments in the form of a Departmental Heatwave Management Plan (PGCD) articulated with the departmental Civil Security Response Organization (ORSEC) system.

The PGCD takes into account the measures defined in the ORSAN system, a tool defining the adaptations to be planned for the organization of care provision in exceptional health situations. In particular, the ORSAN – CLIM component aims to organize the medical care of numerous patients following a climatic phenomenon such as a heatwave.

At the national and local levels, the functionalities of the alert interfaces, as well as the mechanisms for identifying vulnerable people and the operational nature of the planned measures are verified before June 1 .

• **Level 1 - seasonal monitoring (green vigilance card)**

This level 1 corresponds to the activation of a seasonal watch. It includes in particular the implementation of a preventive information system.

Measure sheets to consult: Sheet 1: communication, Sheet 8: level 1 - seasonal monitoring, Sheet 12: departmental version of the PNC

• **Level 2 - heat warning (yellow vigilance card)**

Level 2 – heat warning corresponds to an episode of extreme heat which requires attention, or even special measures, depending on the following possible situations:

an intense heat peak appears and is above the alert thresholds but limited to one or two days;

1. the predicted IBMs are close to the thresholds, but without the weather forecasts showing any intensification of heat for the following days;
2. Predicted IBMs are near thresholds, with weather forecasts predicting a likely intensification of heat. This yellow vigilance is then considered to be the beginning of the arrival of a heatwave. This level implies particular attention and allows the implementation of graduated measures, in particular preparation for an increase in management measures by the ARS, mainly in terms of information and communication, particularly on weekend or daytime eve. holiday.

From the yellow level, succinct information “severe heat” appears in the “comment” box to the right of the meteorological vigilance map and the phenomenon is reported at the departmental level on the website through a tooltip or in the table version of the map. The interregional Directorates of Météo-France then transmit to the zone ARS and the Zone Operational Center (COZ) a special bulletin for the heatwave parameter. This bulletin will specify the meteorological situation causing the severe heat and its expected evolution. The zone ARS will relay this bulletin to the ARS concerned.

The prefect does not trigger level 2 - heat warning.

NATIONAL HEAT WIND PLAN 2017

The ARS take appropriate management measures, in coordination with the department prefectures concerned. These measures are graded according to the specificities of each of the situations described above. The main applicable measures are:

- Strengthening communication measures (see sheet 1); - Strengthening the measures implemented at level 1 - seasonal monitoring (see sheets 2, 3, 4, 5, 6);
- The organization of the ramp-up of the operational system, particularly with a view to a move to level 3 - heatwave alert;
- For the third situation (start of the arrival of a heatwave), local stakeholders are expressly informed by the prefecture of the risks of intensification of heat. They are invited to plan an increase in the load of their system with a view to triggering level 3 - heat wave alert.

Measure sheets to consult: Sheet 1: communication, Sheet 7: general principles of vigilance and heatwave alert, Sheet 9: level 2 - heat warning, Sheet 12: departmental version of the PNC

• Level 3 - heatwave alert

The transition to level 3 can be done following the transition to orange vigilance on the Météo-France map. It leads to the mobilization of the stakeholders concerned and the implementation of management measures adapted to the care of people at risk in particular.

When a department is on orange alert on the Météo-France map with a heatwave pictogram (thermometer), the decision to trigger level 3 - heatwave alert and to activate the PGCD measures is the initiative of the department prefect with the support of the ARS.

The prefect relies on the ORSEC system depending on local needs. Information feedback is put in place concerning the various measures implemented by prefectures and local authorities, in particular through the ORSEC portal.

During this heatwave alert phase, daily monitoring of indicators is carried out by the DGS via SISAC. Health indicators are monitored by the ANSP.

In the event of heatwave episodes, it could be considered to resort to the mobilization of the health reserve, for example to reinforce already overloaded care or medico-social structures, according to the modalities provided for in the framework for the use of the reserve. sanitary.

Exceptionally, depending on the territorial scale and/or duration of the phenomenon, the Prime Minister may be required to activate the Interministerial Crisis Unit (CIC).

If the vigilance card becomes yellow or even green again but a health impact persists, the prefect may, in conjunction with the ARS, decide to maintain the adapted measures of the PGCD.

Measure sheets to consult: Sheet 1: communication, Sheet 7: general principles of vigilance and heatwave alert, Sheet 10: level 3 - heatwave alert, Sheet 12: departmental version of the PNC

• Level 4 - maximum mobilization (red vigilance card)

Level 4 corresponds to a proven exceptional heatwave, very intense and lasting, with the appearance of collateral effects in different sectors (drought, water supply

NATIONAL HEAT WIND PLAN 2017

drinking water, saturation of hospitals or funeral operators, power outage, forest fires, need to adjust working hours or stop certain activities, etc.).

This situation requires the implementation of exceptional measures.

The crisis is becoming intersectoral, it requires maximum mobilization and coordination of the State's response. To do this, the Prime Minister can "entrust the operational management of the crisis to a minister whom he designates according to the nature of the events, the type of crisis or the political direction he intends to give to his action".²

The designation of this minister "results in the activation of the CIC which brings together all the ministries concerned (...)".

When temperatures drop, the maximum level of mobilization may be maintained for reasons other than meteorological reasons while the vigilance card will be a color other than red.

Measure sheets to consult: Sheet 1: communication, Sheet 11: level 4 - maximum mobilization, Sheet 12: departmental version of the PNC

3. Axis 3: Inform and communicate

Specific communication actions are in place from June 1 to August 31.

This communication system aims to raise awareness and protect populations from the health consequences of a heatwave. It is broken down into the four levels of the PNC.

The tools of this system (leaflets, posters, models of press releases, spots, etc.), updated in 2015, are available in the heatwave communication kit made available to communicators from the ARS and prefectures.

Measure sheet to consult: Sheet 1: communication

4. Axis 4: Capitalize on experiences

Following the occurrence of a heatwave or extreme heat event, feedback is organized at national level with all stakeholders. It is based in particular on information collected at the territorial level (prefecture, SIDPC, ARS, DIRECCTE, DDCSPP, Météo-France, ANSP, etc.).

A Monitoring and Evaluation Committee of the National Heatwave Plan and the national guide for prevention and management of health and social impacts linked to cold waves (CSEP) meets twice a year: before the summer season, to present the PNC which will be available locally and at the end of the season, to analyze the events occurring over this period and carry out an evaluation of the PNC.

Measure sheet to consult: Sheet 13: Monitoring and Evaluation Committee of the PNC and the national guide for prevention and management of health and social impacts linked to cold waves (CSEP), Sheet 14: Feedback

² Circular of January 2, 2012 relating to the government organization for the management of major crises.

SHEET 14 : FEEDBACK	-38-

National Heatwave Plan 2017

ANNEX

SHEET 1: COMMUNICATION

The communication system aims to raise awareness and protect populations from the health consequences of a heatwave. It is broken down into two distinct phases: upstream, a “preventive” communication phase, then an “emergency” communication phase which is broken down according to the different levels of the PNC.

The tools of this system (leaflets, posters, press release models, spots, etc.) are available in the heatwave communication kit redesigned in 2015 and made available to communicators from the ARS and prefectures.

I. “ PREVENTIVE ” COMMUNICATION

The “preventive” communication system must make it possible to inform and raise awareness, in advance, of populations about the health consequences of a heatwave and the means to protect themselves from it.

“Preventive” communication is activated at level 1 – seasonal watch from June 1 to August 31, unless specific weather conditions justify its maintenance.

1. The national system

At the start of the summer season, the ministry responsible for health issues a press release informing the public of the triggering of the seasonal watch level of the PNC, the different levels of plans and health recommendations in the event of an episode of high heat. Thematic press releases can be regularly distributed during the summer if necessary.

A special file "heatwave and extreme heat" appears on the ministry's website, comprising, in particular, recommendations allowing different categories of the population to combat the impact of heat and includes a "questions and answers" intended for the general public .

Before the start of the seasonal watch, the National Public Health Agency (ANSP) distributes an information letter to the ARS, prefectural services and numerous institutional, associative and professional partners and networks, presenting the documents made available. Intended for all audiences, and in particular the elderly, these information materials (leaflets, posters) on the prevention of risks linked to heat waves are available to order free of charge. They exist in French and English.

The recipients of the distribution plans will be identical to those of last year. An email communication will also indicate to the ARS the ordering procedure for them and their partners. Please note that these documents are also available for download on the INPES website and that of the Ministry of Health.

- Leaflet “Heatwave, Extreme heat, good reflexes”:
<http://www.inpes.sante.fr/CFESBases/catalogue/pdf/1027.pdf>

- Poster “Heatwave, Extreme heat, good reflexes”:
<http://www.inpes.sante.fr/CFESBases/catalogue/pdf/1028.pdf>

For dependent or fragile elderly people: • Poster: “Heatwave, Extreme heat, good reflexes”

<http://www.inpes.sante.fr/CFESBases/catalogue/pdf/1635.pdf>

National Heatwave Plan 2017

Information leaflets for visually and hearing impaired people also exist: large print version for visually impaired people, also useful for the elderly (this version also exists in Braille), and very visual version for deaf people or having difficulty accessing the written word. A spot in sign language is also available on the INPES website. Dissemination is ensured by the ANSP, in particular via specific networks.

- Version for visually impaired people: http://www.inpes.sante.fr/10000/themes/evenement_climatique/canicule/docs/2009/D-malvoyants.pdf
- Version for deaf people: http://www.inpes.sante.fr/10000/themes/evenement_climatique/canicule/docs/2009/D-sourds.pdf

For health professionals, there is an issue of the Repères pour votre pratique collection entitled "Health risks linked to extreme heat in the elderly". The document can be downloaded from the INPES website.

- <http://www.inpes.sante.fr/CFESBases/catalogue/detaildoc.asp?numfiche=1033>

2. The local device

The PNC leaves significant autonomy to the ARS and prefectural services in matters of information and communication.

The ARS communications officers are essential relays and actors for the implementation of this plan. Indeed, through their knowledge of the context and local interlocutors and operators, they must play a role in terms of design, implementation and monitoring of communication actions. In this way, they also contribute to the actions implemented by the prefectures as part of interministerial communication.

The local system includes the development and implementation of an informative, educational and adapted communication strategy (partnerships, press relations, etc.), making it possible to explain, in advance, the health consequences of a heatwave and the means of protect yourself from it.

This communication strategy must be adapted to local realities and by population type : taking into account the location of establishments for the elderly, nurseries, health establishments, populations at risk or taking into account the constraints of certain sectors of the population. 'activities. It must integrate these issues and provide appropriate tools: development of brochures and posters, holding of awareness stands in public places, creation of heatwave kits for specific populations (people in precarious situations, homeless people, children, etc.), implementation of information and awareness campaigns with professionals (general practitioners, pharmacists, etc.).

The heatwave communication kit, made available to communications officers from the ARS and prefectures, includes all the national tools available.

A local information number must be identified. It is activated when necessary to answer questions from the public.

The distribution of leaflets, brochures and posters is carried out locally by the ANSP through orders from partners and relays (associations, local authorities, etc.).

The delivery of documents is carried out free of charge. The different ordering methods are specified in the communication kit.

National Heatwave Plan

2017 II. “ **EMERGENCY** ” **COMMUNICATION**

“Emergency” communication can be local or national depending on the severity of the situation. It is based on a strengthening of “preventive” communication and on the implementation of complementary actions graduated according to the levels of the PNC activated:

- Level 2 - heat warning (yellow vigilance card);
- Level 3 - heatwave alert (orange vigilance card);
- Level 4 - maximum mobilization (red vigilance card).

It is important to properly coordinate and pool communication actions carried out at the local level (ARS, prefectures, municipalities, etc.) as well as those carried out at the national level.

All stakeholders (central administrations, regional state services, local authorities and health agencies) keep each other informed of the communication actions they undertake in order to guarantee consistency of communication.

1. Setting up a toll-free number

A national telephone number, “canicule info service” (0 800 06 66 66, free toll-free number from a landline in France) is set up as necessary by the ministry responsible for health. Its mission is either to broadcast pre-recorded messages or to answer callers' questions and to publicize recommendations and what to do in the event of extreme heat. In no case does it replace medical regulation to provide answers to sick people.

2. The tools available

The tools can be consulted on:

- <http://www.sante.gouv.fr/canicule>
http://www.inpes.sante.fr/10000/themes/evenement_climatique/canicule/canicule-outil.asp

The printed communication materials (posters, leaflets) available in advance are also intended for the emergency phase.

In the emergency phase, the following are also

- available:
- a television spot intended for the general public which includes the main recommendations for combating the effects of a heatwave and is delivered by the ANSP, before the summer season, to all broadcasters;
 - two radio spots intended for the general public and motorists;
 - additional tools: infographics, Internet banners, bank of pictograms, etc.

From the yellow level, “High heat” information appears in the “comment” box of the meteorological vigilance map and the heat wave phenomenon is reported at the departmental level on the website through a tooltip or in the table version of the vigilance card. Briefly, the expected temperatures and the regions concerned are specified. From the orange level, Météo-France also broadcasts a national bulletin in addition to the vigilance map on the expected weather conditions. This is accompanied by information on the risk incurred and the action to be taken so as to allow relay by the media.

3. The different levels

- **Level 2 - heat warning (yellow vigilance card for Météo-France)**

National Heatwave Plan 2017 Level

2 allows the implementation of graduated measures and possibly preparation for an increase in management measures by the ARS, particularly in terms of information and communication, particularly in the run-up to weekends or public holidays, but also during occasional but very intense heat peaks or heat at the limit of the alert threshold and likely to last for a long time.

It constitutes a reinforced level of communication towards the public and stakeholders (compared to actions carried out during seasonal monitoring). The prefect does not trigger level 2.

To this end, communication is essentially local and may include, in addition to strengthening the distribution of leaflets and posters, the implementation of targeted press relations actions.

Depending on the situation (cross-border holidaymakers on the roads, large-scale sporting events, etc.), the activation or strengthening of the national "heatwave info service" telephone system (0 800 06 66 66) and a relay of the local communication at the national level, in particular on the website of the ministry responsible for health and where applicable, on the Météo-France website, are carried out.

• Level 3 - heatwave alert (orange vigilance card for Météo-France)

Level 3, triggered at the initiative of the department prefect with the support of the ARS, corresponds to the mobilization of services and the implementation of information and management measures adapted to the management in particular of people identified at risk.

Where necessary, communication is managed at the level of the ministry responsible for health.

At the local level, in the event of triggering of level 3 - heatwave alert, state services in the region can in particular:

- inform the general public (in particular via the media) of the triggering of this level, the measures taken by the prefect and all the useful information concerning the provision of care and the necessary community mobilization (solidarity with isolated people);
- strengthen the distribution of leaflets and posters produced by the ministry responsible for health and the ANSP;
- open the local information number in addition to the national platform to provide information on the specific local situation;
- broadcast radio spots, if necessary. In the event of a heatwave limited to a few departments, media mobilization is based on the following recommendations and the practical methods described in the communication kit:

Public radios: mobilization of the local Radio France network Only local Radio

France stations (mainly France Bleu) are subject to the obligation to broadcast radio messages issued by the ministry responsible for health. The mobilization of the local Radio France network is done directly by the prefectures through agreements concluded between the prefect and the local Radio France stations. Coordination and pooling of the prefectures concerned must be favored and sought when possible.

Private radio stations: invitation and non-mobilization

Private radio stations, local or not, are exempt from the mobilization system in the event of a health alert. However, requests to relay alert messages can be made by prefects to private radio stations. This distribution is voluntary and free. Prefectures are asked to send the ministry responsible for health a list of radio channels (including private ones) that have agreed to broadcast the messages sent by the ministry. To this end, the spots can be collected from the ANSP (download from the inpes.sante.fr website or sending the "antenna bands" on request).

National Heatwave Plan 2017 -

broadcast the TV spot, if necessary: mobilization of regional France 3 stations and local television stations. In all cases, the mobilization of France 3 stations in the region must go through the ministry responsible for health.

At the national level, in the event of triggering of level 3 - heatwave alert in one or more departments and as necessary, particularly depending on the situation (number of departments affected, temperature level, crossover, etc.), communication can be managed at the level of the ministry responsible for health. The latter ensures the coordination of communication actions carried out at the local level by the different actors.

The national “emergency” communication system may include, in addition to the implementation of a reinforced press relations system (press releases, press conferences, etc.): - the strengthening of the national “heatwave info service” telephone

system (0 800 06 66 66);

- the broadcast, on the instructions of the Minister responsible for health, of the television spot as well as radio spots on the channels and stations concerned (Radio France, TF1, France 2, France 3, France 4, France 5, Canal +, M6, the TNT channels as well as some local televisions). This provision is part of the system provided for by article 16.1 of the audiovisual law of September 30, 1986 as amended.

Private radio stations, local or not, are exempt from the mobilization system in the event of a health alert. However, the request to relay alert messages can be made by the ministry responsible for health to private radio stations. This distribution is voluntary and free. The spots can, for this purpose, be collected from the ANSP (download from the site inpes.sante.fr or sending “antenna bands” on request).

- activation of the information and alert system via Internet banners and networks social;
- the implementation of partnership actions with associations and relays making it possible to communicate with people at risk (for example, the ANSP broadcasts via its partners the Régie Autonome des Transports Parisiens (RATP) and Presstalis (newsstands), a reserve of 6,600 posters for RATP and 25,000 posters for Presstalis).

• **Level 4 - maximum mobilization (red vigilance card for Météo-France)**

In the event of triggering level 4 - maximum mobilization, communication is managed at the level of the ministry responsible for health or at the interministerial level, particularly within the framework of the interministerial crisis unit.

The national “emergency” communication system may include, in addition to the implementation of a reinforced press relations system (press releases, press conferences, etc.): - the strengthening of the national “heatwave info service” telephone

system (0 800 06 66 66);

- the broadcast, on the instructions of the Minister responsible for health, of the television spot as well as radio spots on the channels and stations concerned (Radio France, TF1, France 2, France 3, France 4, France 5, Canal +, M6, the TNT channels as well as some local televisions). This provision is part of the system provided for by article 16.1 of the audiovisual law of September 30, 1986 as amended.

National Heatwave Plan 2017

Private radio stations, local or not, are exempt from the mobilization system in the event of a health alert. However, the request to relay alert messages can be made by the ministry responsible for health to private radio stations. This distribution is voluntary and free. The spots can, for this purpose, be collected from the ANSP (download from the site inpes.sante.fr or sending “antenna bands” on request).

- activation of the information and alert system via Internet banners and networks social;
- the implementation of partnership actions with associations and relays making it possible to communicate with people at risk (for example, the ANSP broadcasts via its partners the Régie Autonome des Transports Parisiens (RATP) and Presstalis (newsstands), a reserve of 6,600 posters for RATP and 25,000 posters for Presstalis).

The communication actions thus implemented are relayed at the local level by the various actors who can complete the system with their own actions depending on their local specificities and the health situation.

National Heatwave Plan 2017

ANNEX

SHEET 2: ISOLATED PEOPLE

I. IDENTIFICATION AND CENSUS OF ISOLATED PEOPLE AT RISK

Law No. 2004-626 of June 30, 2004 relating to solidarity for the autonomy of elderly people and people with disabilities provides in title 1 for the establishment of a monitoring and alert system. It establishes in each department an Alert and Emergency Plan (**PAU**) for the benefit of the elderly and people with disabilities in the event of exceptional risks.

This plan, adopted jointly by the department prefect and the president of the Council departmental, in cooperation with gerontological policy actors, takes into account the situation of the most vulnerable people due to their isolation. It is implemented under the authority of the department prefect and in Paris, the police prefect.

In accordance with the provisions of this law of June 30, 2004 and articles R.121-2 to R.121-12 of the Social Action and Families Code, the municipalities have set up a nominative register intended to register elderly people and people with disabilities who request it.

Decree No. 2004-926 of September 1, 2004 sets out the methods for collecting, transmitting and using this personal data. He assigns the mayor four missions:

- inform its citizens of the implementation of the register;
- collect registration requests; - ensure its conservation, updating and confidentiality;
- communicate it to the prefect at his request, in the event of triggering of the PAU.

To do this, vulnerable and fragile people are encouraged to register on the municipal registers. The mayor will be able to usefully rely on Home Nursing Services (SSIAD), Home Help and Support Services (SAAD), social services, medico-social teams for personalized allocation to the autonomy, Communal Social Action Centers (CCAS), Gerontological Local Information and Coordination Centers (CLIC) etc.

Municipal services, in order to encourage the intervention of social and health services, ensure that, among the information appearing in the nominative register, elements relating to the identity, age and residence of elderly people are included. and people with disabilities who have requested it and, where applicable, the contact details of the service providing assistance at home, the person to be notified in the event of an emergency and the contact details of the attending physician.

II. MOBILIZATION OF MAYORS AND ASSOCIATIONS

As part of actions concerning the elderly, people with disabilities, homeless people or people in precarious situations, national associations are made aware of the need to mobilize their networks. A certain number of them are committed, under a framework agreement, to strengthening their collaboration with the State thanks to the assistance of volunteers whose role and missions are essential in relaying information and protection actions for fragile people. Among the associations having signed a framework agreement, some of them, which are approved under civil security, constitute, as such, auxiliaries of the public authorities and may be required to help municipalities in difficulty.

National Heatwave Plan 2017

Other national associations provide concrete responses of solidarity towards isolated and fragile people. The prefects are invited, at the local level, to bring together associations that can get involved in actions relating to the heatwave and to continue to conclude agreements to make their collaboration even more effective and concrete.

Prefects are also invited to raise awareness among mayors so that, if necessary, they can call on the local branches of national associations and local associations, particularly in the event of triggering level 3 - heatwave alert.

It is therefore up to the services placed directly under the authority of the State representative (prefecture services and/or Departmental Directorate of Social Cohesion and Population Protection (DDCSPP) to ensure the mobilization of local authorities and the implementation of their legal obligations.

National Heatwave Plan 2017

ANNEX

SHEET 3: PEOPLE IN PRECARITY AND HOMELESS SITUATIONS

In the event of a heatwave, the vulnerability of isolated and precarious homeless people is aggravated by the lack of amenities and requires special attention.

The department prefect ensures, in conjunction with the associations and institutional partners concerned, the availability of accommodation and day care places as well as the mobilization of mobile teams (maraudes) or any other monitoring system social, mentioned in article L. 345-2 of the social action and families code.

For people usually living in precarious housing, the department prefect, where possible, in conjunction with associations, ensures that visits are reinforced or initiated in order to remind people of essential prevention measures. For people on the street, mobile teams such as "SAMU social" or any other social monitoring system contribute to their identification and support to help them cope with the difficulties resulting from their lifestyle and their condition. health.

Integrated Reception and Orientation Services (SIAO) provided in each department since the publication of decree no. 2015-1446 of November 6, 2015 relating to integrated reception and orientation services or mobile teams of the "SAMU" type social » ensure the orientation of people who accept it towards a suitable reception place (day reception, accommodation center) and call in the event of a medical emergency situation at Center 15.

Accommodation centers and day centers are putting in place prevention and monitoring protocols to prevent the risks posed by the heatwave to a population weakened by its desocialization and health problems.

The multi-year plan against poverty and for social inclusion set the ambitious objective of putting an end to the seasonal management of the system. However, this objective does not exclude the temporary opening of shelter places to meet exceptional and time-limited needs. Shelter places constitute additional capacities, which can be mobilized quickly to deal with one-off events or specific local circumstances.

Shelter can therefore be defined as a temporary accommodation service, quickly mobilized, whose function is to shelter and protect homeless people in situations of medical, psychological or social distress while respecting the unconditional reception in exceptional circumstances, one-off events or specific local situations such as heat waves.

National Heatwave Plan 2017

ANNEX

SHEET 4: YOUNG CHILDREN

The heat quickly exposes infants and young children to dehydration which can be dreadful. These children also cannot access adequate fluid intake without external help. The prefects remind the managers of establishments and services for children under six years of age, maternal centers, and collective reception of minors (with or without accommodation), of the recommendations for action, in order to ensure the refreshment of children and infants.

In reception establishments, before summer, it is appropriate, on the one hand, for the departmental Maternal and Child Protection (PMI) service to check whether a specific arrangement of a cooler room is possible and whether the devices and the equipment (blinds, shutters, cooling systems, refrigerator, freezer, etc.) is working and on the other hand, that professionals are made aware of preventive measures and the detection of clinical warning signs of exposure to heat.

National Heatwave Plan 2017

ANNEX

SHEET 5: WORKERS

Some workers may be more exposed than others to the risks associated with high heat.

In order to limit workplace accidents linked to such climatic conditions, simple measures aimed at ensuring the safety and protecting the health of workers are required by employers.

I. THE RESPONSIBILITY OF THE EMPLOYER (LEGAL REFERENCE FRAMEWORK)

With regard to articles L. 4121-1 et seq. and articles R. 4121-1 et seq. of the labor code, employers have the responsibility to take the necessary measures to ensure the safety and protect the health of workers in their establishments, taking into account climatic conditions in particular. More targeted measures are also planned.

Decree No. 2008-1382 of December 19, 2008, relating to the protection of workers exposed to particular climatic conditions, notably supplemented article R. 4121-1 of the labor code. This now provides that any employer must take into consideration "thermal environments", including the risk of "high heat", as part of their risk assessment process, the development of the single document for assessing risks (DUER), and the implementation of an action plan providing for corrective measures.

These measures fully echo the ambitions of the 2016-2020 occupational health plan (PST3). Its absolute priority is to strengthen primary prevention, protecting workers from the occurrence of a risk to their health. The measures implemented by the employer within the framework of the PNC fully respond to the desire, pursued by the PST3, to move, employer and worker jointly, towards the appropriation of a culture of prevention.

II. IMPLEMENTED BY THE DECONCENTRATED SERVICES OF THE MINISTRY OF LABOR AND THE PREVENTERS NETWORK

has. Piloting:

- Permanent circular: DGT circular no. 9 of July 4, 2013 relating to the implementation of the national heatwave plan
(http://circulaire.legifrance.gouv.fr/pdf/2013/07/cir_37208.pdf)
- Ad hoc instruction aimed at supporting the measures likely to be taken by the decentralized services of the ministry responsible for labor and informing operators (National Agency for the Improvement of Working Conditions (Anact), National Institute for Research and Safety (INRS), the Retirement and Occupational Health Insurance Funds (Carsat) and sensitive sectors (OPPBTP), with regard to the action plan of the Ministry of Labor resulting from a high heat alert.

National Heatwave Plan 2017

b. Measures

The Regional Directorates for the Economy, Competition and Consumption, Labor and Employment (Dirccte) are particularly invited to encourage companies to adapt the organization of work in anticipation of extreme heat.

In this context, they can:

- mobilize occupational health services, through occupational medical inspectors, so that occupational physicians advise employers (R. 4623-1) on the precautions to be taken with regard to employees, especially those who are those most exposed to the risks linked to the heatwave, and correctly inform their employees;
- provide for increased vigilance of labor inspection in the sectors of activity most affected by the risks linked to heat waves and thermal environments, in particular building and public works, but also other sectors (in particular: catering, bakery, dry cleaning). Also intended to require vigilance, driving vehicles, seasonal jobs outside (e.g. beaches, etc.), etc. In this context, the labor inspectorate encourages employers to report each workplace accident.

ANNEX

SHEET 6: HEALTH AND MEDICO-SOCIAL ESTABLISHMENTS

In exceptional health situations, the organization of outpatient, hospital and medico-social care is governed by the ORSAN plan.

The ORSAN – CLIM component aims to optimize the organization of healthcare provision to prevent direct and indirect health and social consequences linked to climatic episodes such as heatwaves. The main challenge is to reduce the number of unjustified hospitalizations and facilitate discharges to allow medical and social care of patients in the best possible conditions.

The ARS implement the measures of this system, as necessary, within the framework of the PNC.

I. PROTECTION OF PEOPLE AT RISK IN ESTABLISHMENTS

Decree No. 2005-768 of July 7, 2005 relating to the minimum technical operating conditions of establishments providing accommodation for the elderly strengthened the legal basis of the priority measures described below with the aim of making them enforceable against managing organizations .

1. Establishments welcoming the elderly

Implementation of a “blue plan”

In accommodation establishments for dependent elderly people (EHPAD), in establishments welcoming elderly people (EHPA) (retirement homes, residential homes) and in long-term care units, the monitoring and alert plan is based on the establishment of a “blue plan” setting out for each public, private, associative or commercial institution the general mode of organization to respond to a crisis situation. This plan details the organizational arrangements to be implemented in the event of a health or meteorological crisis, in application of Decree No. 2005-768 of July 7, 2005. This defines in particular the role and responsibilities of the management team. , the procedures that prevail in the event of a crisis, the staff mobilization protocols, the level of equipment and stocks necessary to deal with a long-term crisis and the methods for raising staff awareness of good prevention practices.

One of the essential elements of this plan is the agreement concluded with a nearby health establishment, setting out the terms of cooperation and exchanges on good practices helping to prevent the effects of heat on health and to avoid hospitalizations.

For EHPADs, the coordinating doctor ensures the application of good practices likely to prevent hospitalizations as well as the rules for hospital transfers when they prove essential, including in the event of exceptional health risks, and makes any useful recommendations. in this area and gives an opinion on the content and the implementation, in the establishment, of an organization adapted to exceptional risks.

Refreshed room

The installation of at least one cooled room in all establishments welcoming the elderly (EHPA, EHPAD and health establishments) constitutes an effective response to combat the effects of very high heat and the consequences they have for people. fragile. This is an imperative, displayed and recalled as being a

National Heatwave Plan 2017 priority

measure of the PNC, and provided for by articles D. 312-160 and D. 312-161 of the social action and families code.

Emergency Liaison File (DLU)

In EHPADs, access to the medical and care files of authorized persons must be facilitated, particularly in the event of urgent medical care for a resident. For EHPADs that do not have medical files accessible 24 hours a day to an emergency doctor, the General Directorate of Social Cohesion (DGCS) developed and distributed in 2008 a DLU, a summary document on medical and paramedical care. of each resident to be implemented obligatorily. The coordinating doctor of the EHPAD will ensure that this DLU is regularly updated by the attending physician.

2. Establishments welcoming people with disabilities

By letter dated June 14, 2007 to the attention of the prefects, the general director of social action requested that all establishments housing or welcoming people with disabilities during the summer period implement the recommended measures within the framework of blue plans, by assimilation with the systems which are operational in EHPAs.

II. ORGANIZATION OF AMBULATORY AND HOSPITAL CARE

1. Continuity of care in outpatient medicine

Continuous care is a public service mission (L. 6112-1 of the Public Health Code).

Thus, the ARS are paying increased attention to the organization of on-going care in outpatient medicine during the summer period. The ARS rely on the Departmental Committee for Urgent Medical Aid and Continuity of Care (CODAMUPS), in conjunction with the departmental councils of the order of doctors, so that the sectorization is adapted to the demand of the population and the provision of care, taking into account the leave of private doctors and the closure of medical practices.

It is recommended that solutions be studied within CODAMUPS and in conjunction with health establishments when the usual organization of on-going ambulatory care cannot be ensured during the summer period, so that the response to requests for care not scheduled can be ensured.

Finally, the CODAMUPS will consider setting up a specific organization to strengthen the permanence of outpatient medicine care in the event of a heatwave or health crisis in the summer.

2. Preparation of the organization of care provision in public and private health establishments

The programming of hospitalization capacities and their adaptation according to seasonal fluctuations is the subject of anticipated and coordinated reflection on the part of the directors general of the ARS at the regional level and within each health territory.

The ARS must also be vigilant in coordinating health establishments in order to guarantee a balance between bed availability and needs, particularly during holiday periods.

Particular attention must be paid to adapting hospitalization capacities in intensive care and continuous monitoring units, in burn units, in adult, pediatric and neonatal intensive care units and in nursing units.

National Heatwave Plan 2017

multipurpose medicine. It is also recommended to ensure hospitalization capacities for short geriatric stays and follow-up and rehabilitation care.

To deal with a possible heatwave episode, establishment directors will rely on the operability of their various internal systems for preparing for exceptional health situations, in particular:

- the "hospital under pressure" system and the establishment white plan, defined by the instruction of September 14, 2006 relating to the development of white plans for health establishments and expanded white plans;
- the establishment's business continuity plan.

The establishment medical commission or the establishment medical conference contributes to the development of these provisions.

The formalization of relationships between emergency services and other hospital services, within the healthcare territory through the emergency network, is a determining factor for good management of patient flows and their care.

The health establishment has indicators on the management of beds by specialty, analyzes its activity and adjusts the measures to be implemented, in conjunction with the establishment's monitoring unit, with a view to guaranteeing the quality of care and to anticipate tension phenomena.

The emergency network (constitutive agreement, resource directory, malfunction sheet) being a key element of the territorial organization of emergencies, the general directors of the ARS will ensure the use of malfunction sheets, in accordance with the circular of February 13 2007 relating to emergency management.

National Heatwave Plan 2017

ANNEX

SHEET 7: GENERAL PRINCIPLES OF VIGILANCE AND HEAT WAVE ALERT

The different levels of the PNC are linked to the four colors of meteorological vigilance. On the basis of Météo-France's meteorological vigilance map, department prefects can trigger level 3 - heatwave alert.

I. THE WEATHER WATCH PROCEDURE

This meteorological vigilance system, specified in interministerial circular no. IOC/E/11/23223/C of September 28, 2011, sets the framework for weather vigilance and alert procedures in metropolitan France.

It is formalized by a map of metropolitan France which indicates if a danger threatens one or more departments in the next twenty-four hours, using four colors (green, yellow, orange, red) indicating the level of vigilance necessary. Permanently available on the Météo-France website (<http://vigilance.meteofrance.com>), this map is updated twice a day at 6 a.m. and 4 p.m., more frequently if the situation requires it. The vigilance card is aimed at the entire population.

Vigilance météorologique

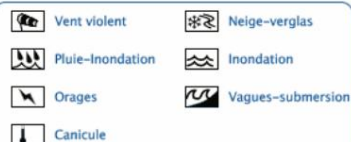

La carte est actualisée au moins 2 fois par jour, à 6h et 16h.

Une vigilance absolue s'impose des phénomènes dangereux d'intensité exceptionnelle sont prévus...

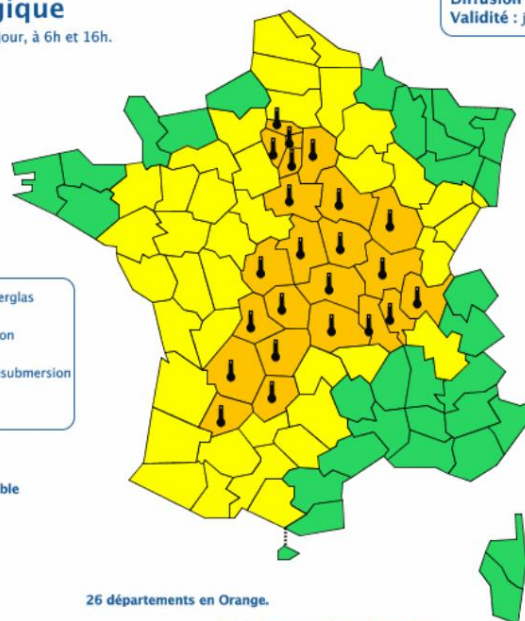

Soyez très vigilant, des phénomènes dangereux sont prévus...

Soyez attentif si vous pratiquez des activités sensibles au risque météorologique...

Pas de vigilance particulière.

Les vigilances pluie-inondation et inondation sont élaborées avec le réseau Vigicrues du Ministère du Développement durable

26 départements en Orange.

METEO FRANCE
Toujours un temps d'avance

Diffusion : le lundi 29 juin 2015 à 16h00

Conseils des pouvoirs publics :
Canicule/Orange – Passez au moins 3 heures par jour dans un endroit frais. – Rafrâchissez vous, mouillez vous le corps plusieurs fois par jour. – Buvez fréquemment et abondamment même sans soif. – Évitez de sortir aux heures les plus chaudes.

Copyright Météo-France

Météo-France Vigilance Map

In addition, a summary table of all the departments with, for each of them, the list of red, orange or yellow alert phenomena is accessible on the site from the tab above the map entitled: "Table version". Sorting is possible by departmental registration number or by vigilance level from red to yellow.

This same table is distributed by email to meteorological vigilance partners.

For the heatwave, from the yellow level in at least one department a national comment accompanies the vigilance map, in the box placed to the right of the vigilance map. Of

National Heatwave Plan 2017 plus,

for each department in yellow vigilance, the list of all the phenomena concerned by yellow vigilance is available online in a tooltip displayed when hovering over the department and on smartphones in the "Departments in vigilance" section .

The pictogram corresponding to the heatwave appears on the map from the orange level.

If high intensity dangerous phenomena are forecast, the department(s) concerned appear in orange. They appear in red in cases of exceptional intensity. A pictogram specifies the type of phenomenon expected (violent wind, rain-flood, flood, thunderstorms, snow-ice, avalanches, waves-submersion, heatwave, extreme cold). In the event of multiple orange phenomena including heatwaves, the heatwave pictogram is systematically displayed in juxtaposition to another meteorological phenomenon. On the website or on smartphones, the list of all phenomena affected by the orange or red level is accessible.

When the map includes an orange or red zone, it is accompanied by regular monitoring bulletins specifying, in particular, the evolution of the phenomenon in terms of geographical location, chronology and intensity. These bulletins are updated as frequently as necessary and the possible consequences (example: the increase in temperature can endanger people at risk, that is to say the elderly, people with disabilities, suffering from chronic illnesses or mental disorders, people who regularly take medication, isolated people) and behavioral advice are indicated (examples: spend at least three hours a day in a cool place, cool off, wet your body several times times a day).

In the event of orange or red level vigilance, the national monitoring bulletin is accessible directly under the map.

The "orange" and "red" levels highlight dangerous phenomena that are likely not only to mobilize the services responsible for civil or health security, but also to concern the entire population. This focus on high-impact phenomena is the necessary condition for the credibility of the procedure and compliance with behavioral advice by populations where applicable.

The PNC levels will be consistent with the weather alert colors for the "heatwave" parameter:

Weather alert map	PNC levels
Green	Level 1 - seasonal monitoring
YELLOW	Level 2 - heat warning
orange	Level 3 - heatwave alert
red	Level 4 - maximum mobilization

In the departments concerned by orange vigilance for the "heatwave" parameter, the decision to trigger level 3 - heatwave alert of the PNC is the responsibility of the department prefect who, where applicable, integrates cyclical data (level pollution, population factors such as large gatherings, etc.) and in particular data transmitted by the ARS.

Once level 3 - heatwave alert of the PNC is activated, the prefect takes all appropriate measures within the framework of the PGCD. The triggering of level 3 - heatwave alert does not imply the systematic application of all PGCD measures. Indeed, the management measures proposed in the PGCD can be implemented in a graduated and proportional manner depending on the analysis of the situation and the additional information available to the prefects (see sheet 10).

National Heatwave Plan 2017

At the end of a heatwave episode, when the IBMs fall below the alert thresholds and Météo-France changes its level of vigilance to yellow or even green in the departments concerned, but a health impact persists, the ARS will be able to recommend to prefects that adequate PGCD measures be maintained.

II. THE HEAT WIND AND HEALTH ALERT SYSTEM (BAGS)

The vigilance procedure also integrates the expertise of the Heatwave and Health Alert System (SACS). This system was developed from a frequency analysis of thirty years of daily mortality data and various meteorological indicators.

This analysis made it possible to identify the BioMeteorological Indicators (BMI), which are the averages over three consecutive days (the IBM of day D is the average of D, D+1, and D+2) of minimum temperatures (IBM min) and maximum (IBM max) as being the most relevant for identifying heatwave episodes in mainland France.

Departmental alert thresholds have been defined for these two indicators and are reassessed regularly. The probability of simultaneously reaching or exceeding the thresholds by the IBM min and IBM max for a given department constitutes the basic criterion for choosing the color of the vigilance map by Météo-France.

Other meteorological indicators considered as aggravating factors (deviations from the temperature thresholds which make it possible to estimate the intensity of the heatwave, relative humidity of the air, duration of the heatwave, precocity of the heat, air pollution) as well as possible health feedback provided by health services (ANSP, ARS), will also be taken into account.

BioMeteorological Indicators (BMI)

For each department, a reference city has been defined with which is associated a minimum Biometeorological Indicator threshold (IBMn) and a maximum Biometeorological Indicator threshold (IBMx).

Alsace																						
Department	City Threshold	Para m	D-1	J	D+1	D+2	D+3	D+4	D+5													
DOWN- RHINE	Strasbourg 19/34	IBMn/ IBMx	20.5	31.0	29.8	30.5	29.2	30.3	20.3	31.7	19.5	30.7	19.0	31.3	18.5	20.5	34.0	20.8	34.5	22.2	33.0	32.3

	Very high risk
	High risk
	Medium risk
	Low risk
	Almost zero risk

Example for the Bas-Rhin department: the reference city is Strasbourg with an IBMn threshold of 19°C and IBMx of 34°C. For each day from D-1 to D+5 the IBMn and IBMx in degrees Celsius are indicated, knowing that the IBM of day D is the average of D, D+1 and D+2.

Each IBM is associated with a level of risk. It ranges from very high to almost zero and, in order to enable rapid reading of the table, colors (from dark brown to white) have been associated with them.

National Heatwave Plan 2017

The SACS is operational from June 1 to August 31 each year. During this period, Météo-France provides the ANSP with technical information for all metropolitan departments on a dedicated extranet site including: a national table of IBM forecasts from D-1 to D+5 and temperatures from D-1 to D+7, BioMeteorological risk maps, observed and forecast temperature curves by station and by region. The IBM forecast and temperature tables are also sent by Météo-France to the ANSP by email.

At the same time, Météo-France feeds every day an extranet site dedicated to the DGS, the prefectures and the ARS (<http://www.meteo.fr/extranets>) including: the vigilance map, the temperature curves by station observed, the table of IBM and forecast temperatures for all metropolitan departments, as well as observed and forecast temperature curves on a regional scale.

The ANSP collects, monitors and analyzes health indicators making it possible to estimate the impact of heat.

• If a significant impact is detected, the ANSP will inform the DGS and Météo-France from 2:30 p.m. The definitive national health analysis, as well as a summary of the local health analysis provided by the Regional Intervention Units (CIRE), will be transmitted to the DGS via the Daily Alert Bulletin (BQA), around 6 p.m.

• If no impact is detected, the ANSP will inform the DGS via the Daily Bulletin of Alerts (BQA), around 6 p.m.

In the event of orange heatwave vigilance, the ANSP will transmit the national health analysis every day (working and non-working days). The local health analysis will be transmitted every working day, starting the day after the day of transition to level 3 - heatwave alert. This analysis may be transmitted on non-working days, at the express request of the DGS or the ARS in the event of a sensitive situation due to the scale or context.

In the event of a heatwave red alert, the ANSP will transmit the national and local health analysis every day (working and non-working days).

III. THE MONITORING AND ALERT NETWORK BASED ON HEALTH DATA

Since 2004, the ANSP has been piloting the SurSaUD® syndromic surveillance system (Health Surveillance of Emergencies and Deaths); it integrates a daily computerized report of the activity of the emergency services participating in the OSCOUR® network (Organization of Coordinated Surveillance of EMERGENCIES) and, since 2006, data from the SOS Médecins associations has supplemented this system.

The decree of July 24, 2013³ and its accompanying instruction describe the principles of compulsory reporting of information from emergency structures to the Technical Agency for Hospitalization Information (ATIH) and the ANSP in order to supply notably the OSCOUR® device.

Furthermore, the ANSP receives mortality data transmitted by INSEE for a sample of 3,000 computerized municipalities, which represent nearly 80% of deaths in France. They are available within a minimum of 14 days and require a period of one month to be consolidated.

³

decree of July 24, 2013 relating to the collection and processing of medical activity data produced by public or private health establishments carrying out emergency medicine activity and the transmission of information resulting from this processing under the conditions defined in article L.6113-8 of the public health code and for the purposes of health monitoring and safety

National Heatwave Plan 2017

The health indicators monitored are as follows:

• visits to emergency services: total first visits for all causes for all ages, first visits for all causes for people over 75 years of age, first visits for all ages for specific causes linked to heat (hyperthermia, hyponatraemia, dehydration);

• SOS Doctors visits for all causes, all ages; and for specific causes linked to heat (hyperthermia, dehydration)

• deaths from all causes for all ages from INSEE.

Health morbidity indicators make it possible to quickly analyze the health impact of a heat wave on the use of emergency care. Mortality indicators cannot be used immediately following a heat wave, but will be analyzed at the end of the season to take stock.

IV. THE REGIONAL HEALTH SUMMARY POINT

1. Systematic returns

Since the summer of 2009, the system of weekly feedback of information on health establishments has been sustainable. The objectives of this process are on the one hand to have a synthetic image of the state of care provision in health establishments, and on the other hand to highlight the phenomena of tension. Based on feedback from the ARS, the Operational Center for Reception and Response to Health and Social Emergencies (CORRUSS) of the DGS produces the national bulletin of hospital activities and capacities as well as the national summary map.

The data collected by the ARS are as follows:

- list of departmental mobilization plans⁴ implemented in the region; list of health
- establishments under pressure, with actions carried out;
- list of health establishments having activated their white plan;
- pre-hospital activity; - activity
- in emergency services; - occupancy rate in
- certain hospital departments.

2. Ascents in alert situation

From the day after the prefect triggers a level 3 - heatwave alert until the day after the alert is lifted decided by the prefect, the ARS informs the "heatwave" portal daily via SISAC with the following elements:

- the measures implemented;
- data relating to hospital activities and capacities;
- any difficulty encountered in the health and medico-social fields.

In any case, this reporting of health information must be carried out in close collaboration between the ARS on the one hand and the department prefectures on the other.

⁴ Formerly "extended white plans", modified by article 158 of law no. 2016-41 of January 26, 2016 on the modernization of our health system (article L. 3131-8 of the Public Health Code)

National Heatwave Plan 2017

After the day after the alert is lifted, independently of this system, the ARS are asked to inform the CORRUSS of any situation of hospital tension linked to heat, following the example of what is done throughout the year excluding the period concerned by the PNC.

V. THE NATIONAL HEALTH SUMMARY POINT

From the day after the prefect triggers a level 3 - heatwave alert until the day after the alert is lifted decided by the prefect, on the basis of regional health summaries and health data from the ANSP, CORRUSS transmits the national health synthesis to the ARS, the Operational Center for Interministerial Crisis Management (COGIC), the ministerial operational monitoring and alert unit of the Ministry of the Environment, Energy and the Sea (CMVOA) and its institutional partners.

National Heatwave Plan 2017

ANNEX

SHEET 8: LEVEL 1 - SEASONAL WATCH

The seasonal watch level is activated automatically from June 1 to August 31 each year. Before June 1, each service concerned verifies the proper functioning of the alert systems as well as the potentially operational nature of the measures provided for in the PGCD. In the event of early or late heat, seasonal monitoring can be activated before June 1st or extended after August 31st. Level 1 - seasonal watch corresponds to a green color on the weather alert map.

I. THE NATIONAL SYSTEM

1. Communication (see sheet 1: communication)

The “preventive” communication system must make it possible to inform and raise awareness, in advance, of populations about the health consequences of a heatwave and the means to protect themselves from it. “Preventive” communication is activated from June 1 to August 31, unless specific weather conditions justify its maintenance.

At the start of the seasonal watch or in anticipation of the first episodes of high heat, the ministry responsible for health issues a press release informing the general public of the activation of the seasonal watch level of the PNC, basic advice on the prevention of risks linked to extreme heat and the management and communication measures planned in the event of extreme heat or heat waves. Thematic press releases can be regularly distributed during the summer if necessary.

A special file “heatwave and extreme heat” is available on the ministry’s website. It contains all the useful information and in particular, the recommendations allowing different categories of the population to combat the impact of heat and includes a “questions and answers” intended for the general public.

At the same time, before the start of the seasonal watch, the ANSP distributes and makes available to ARS, prefectural services and numerous institutional, associative and professional partners and networks, information materials (leaflets, posters) on prevention risks linked to heat waves. They are intended for all audiences and in particular for the elderly and people with difficulty accessing reading (in a precarious situation, with a disability, etc.) and are available in French and English.

Météo-France feeds specific websites every day intended on the one hand for the ANSP and on the other hand for the prefectures, the ARS and the DGS. (see sheet 7: general principles of vigilance and heatwave alert).

2. Biometeorological monitoring

SACS is activated from June 1 to August 31 each year. During this period, Météo-France analyzes the meteorological risk and sends daily to the SACS stakeholders an analysis of the situation including in particular the table of IBMs assigned colors according to the probabilities of exceeding the thresholds.

Météo-France sends partners a list of local Météo-France representatives who can be contacted to provide technical expertise in their field of expertise.

National Heatwave Plan 2017

II. THE LOCAL DEVICE

The local system is implemented in application of the PGCD (see sheet 12).

The PNC leaves significant autonomy to the ARS and prefectural services in matters of information and communication.

The ARS communications officers are essential relays and actors for the implementation of this plan. Indeed, through their knowledge of the context and local interlocutors and operators, they must play a role in terms of design, implementation and monitoring of communication actions. In this way, they also contribute to the actions implemented by the prefectures as part of interministerial communication.

National Heatwave Plan 2017

ANNEX

SHEET 9: LEVEL 2 - HEAT WARNING

Level 2 - heat warning responds to the yellow vigilance level for the “heatwave” parameter of the weather vigilance card.

I. DESCRIPTION OF THE PHENOMENA CONCERNED

Level 2 – heat warning corresponds to an episode of extreme heat which requires attention, or even special measures, depending on the following possible situations:

1. an intense heat peak appears and is above the alert thresholds but limited to one or two days;
2. the predicted IBMs are close to the thresholds, but without the weather forecasts showing any intensification of heat for the following days;
3. Predicted IBMs are near thresholds, with weather forecasts predicting a likely intensification of heat. This yellow vigilance is then considered to be the beginning of the arrival of a heatwave. This level implies particular attention and allows the implementation of graduated measures, particularly in terms of information and communication, particularly before weekends or public holidays.

From the yellow level, succinct information “High heat” appears in the “comment” box to the right of the weather alert map and the phenomenon is reported at the departmental level on the website through a tooltip or in the table version of the map. The interregional Directorates of Météo-France then transmit to the zone ARS and the Zone Operational Center (COZ) a special bulletin for the heatwave parameter. This bulletin will specify the meteorological situation causing the severe heat and its expected evolution. The zone ARS will relay this bulletin to the ARS concerned.

II. MEASURES TAKEN AT LEVEL 2 – HEAT WARNING

• At the territorial level

The prefect does not trigger level 2 - heat warning.

The ARS take appropriate management measures in coordination with the department prefectures concerned. These measures are graded according to the specificities of each of the situations described in the previous paragraph. The main applicable measures are:

- Strengthening communication measures (see sheet 1);
- Strengthening the measures implemented at level 1 - seasonal monitoring (see sheets 2, 3, 4, 5, 6, 12);
- The organization of the ramp-up of the operational system (on-call, etc.), particularly with a view to moving to level 3 - heatwave alert;
- For the third situation (start of the arrival of a heatwave), local stakeholders are expressly informed by the prefecture of the risks of intensification of heat. They are invited to plan an increase in the load of their system with a view to triggering level 3 - heat wave alert.

National Heatwave Plan 2017

- **On a national level**

At the national level, a telephone coordination point between Météo-France, InVS and the DGS can be organized and communication measures can be reinforced.

National Heatwave Plan 2017

ANNEX

SHEET 10: LEVEL 3 - HEAT WEATHER ALERT

Level 3 - heatwave alert corresponds to an orange weather alert for the heatwave parameter.

I. MEASURES TAKEN AT LEVEL 3 - HEAT WIND ALERT

1. At the national level

Transmission of health information

The ANSP analyzes, from the day after the first day of switching to orange vigilance, the health indicators of mortality and morbidity provided for in its surveillance system, at local and national levels.

If an impact is detected, the ANSP organizes a telephone briefing around 2:30 p.m. with the DGS and Météo-France in order to inform them of the situation. This allows Météo-France to modify, if necessary, the color of the 16-hour vigilance card, and the DGS to summarize the various reports (ANSP health data, hospital activities and capacities, etc.) that it transmits to the various partners of the PNC. The national health analysis, as well as a summary of the regional health analysis provided by the CIREs, is transmitted to the DGS via the Daily Alert Bulletin (BQA) around 6 p.m.

If no impact is detected, the ANSP also informs the DGS via the Daily Alert Bulletin (BQA) around 6 p.m.

Exchanges with the stakeholders concerned

The DGS analyzes the health indicators communicated by the ANSP and the ARS and transmits the national health summary, particularly in the health and medico-social fields, to institutional partners.

If an impact is noted, particularly on the provision of care, the DGS organizes conference calls, if necessary, with the various stakeholders concerned to assess the situation and propose additional management measures. It will be able to bring together representatives of the ANSP, Météo-France, the General Directorate of Civil Security and Crisis Management (DGSCGC), the DGOS, the DGCS, the department prefects and the ARS concerned.

In the event of heatwave episodes, it could be considered to resort to the mobilization of the health reserve, for example to strengthen the already overloaded care or medico-social structures, according to the modalities provided for in the framework of use of the health reserve. sanitary reserve.

Point position

The DGS is organizing a conference call at 6:30 p.m. to assess the situation, take stock of the management measures implemented and any difficulties encountered at the local level.

It brings together the DGSCGC, the DGS, the DGOS, the DGCS, the CMVOA, the ANSP and Météo-France.

The frequency of this conference call is adjustable depending on the evolution of the situation and/or at the request of the participants.

National Heatwave Plan 2017 If

sectors other than the health and medico-social sectors are affected, a national situation report giving an analysis of the context is drawn up by the DGS following the audio conference and based on the elements transmitted by each of the entities concerned.

This is then sent to each of the partners who participated. The DGS may include in its mailing list the functional email addresses of partners not falling within its field of competence. These address lists must be fixed and transmitted to the DGS before the summer season.

Permanent information to the public

The weather alert map displays in yellow, orange or red the departments affected by a risk of heatwave within twenty-four hours. Monitoring bulletins are issued by Météo-France in the event of orange or red vigilance (for more details, see sheet 7).

The ANSP publishes a message on its website including, if necessary, a summary of the health situation and prevention advice in the event of extreme heat.

All elements relating to public information are described in sheet 1: communication.

2. At the local level

The ARS

Organization of the health and medico-social response

In accordance with the provisions of the ORSAN – CLIM component, the organization of the health and medico-social response is carried out by the ARS, under the authority of the prefect, who ensures in particular:

- the effectiveness of the permanence of care in outpatient medicine and the good healthcare system response;
- the mobilization of establishments welcoming elderly people and people with disabilities by activating the measures provided for in their "blue plan". She oversees this mobilization in conjunction with the Departmental Council.

It also verifies, using the data collected, the adequacy of the measures implemented in the situation.

From the day after the prefect triggers a level 3 - heat wave alert in at least one department of the region and until the day after the alert is lifted decided by the prefect, the ARS carries out a daily health summary regional by completing the "heatwave" portal via SISAC with the following elements:

- the measures implemented;
- data relating to hospital activities and capacities; - any difficulty encountered in the health and medico-social fields.

In the event of a health situation in one or more departments, the ARS informs the prefect(s) of the department(s) concerned. The ARS provides its expertise to the prefect as necessary. From the day after the day of transition to level 3 - heatwave alert, the health information defined within the framework of the SACS is analyzed by the CIRE in each region on a working day (and non-working day, at the express request of the DGS or the ARS in the event of a sensitive situation due to the scale or context).

Please note that any situation of tension or health difficulty which has not been reported on the "heatwave" portal via SISAC by 5:30 p.m. must be reported by message sent to the alert box of the Ministry of Health: alert@sante.gouv.fr.

National Heatwave Plan 2017

ÿ Within health establishments in the event of hospital tensions

If a tense situation is confirmed, the monitoring unit of the health establishment transforms, under the authority of the director of the establishment, into a restricted crisis unit.

This unit takes note of the planned activity, checks the actual availability of beds and encourages the organization of early exits. She communicates the situation within the establishment and informs the ARS daily of developments in the situation until a return to normal. If the situation continues, it adapts the bed capacity, organizes early discharges and deprogramming, ensures the management of additional material and human resources mobilized in a graduated manner and adapted to the situation to control the flow of patients sent to emergencies, in link with SAMU – Center 15.

When the various recommended elements implemented are not sufficient to adapt the hospital care offer to demand, the establishment director can trigger the establishment "white plan", by informing the department prefect and the ARS . However, this plan is normally reserved for an exceptional event with serious health consequences, exceeding the immediate capacity for appropriate response. The "white plan" is triggered if the situation of tension is combined with sustained activity and restricted reception capacity.

The constituent elements of the departmental mobilization plans⁵ are activated by the department prefect on the proposal of the director general of the ARS, if the event takes on such a magnitude that it takes hold over time and results in a context of tension on the The provision of care, involving a coordinated mobilization of all ambulatory and hospital health professionals, from the private and public sectors, and from health and prefectural authorities at different decision-making levels.

ÿ Support for prefects

In addition to exercising its own responsibilities in terms of prevention, care and medico-social support, the ARS provides support to prefects in the implementation of the heatwave system by managing the Regional Support and Management Unit. Health Management (CRAPS) and by participating in the Departmental Operational Center (COD), in accordance with articles L.

1435-1, L.1435-2 and R.1435-1 et seq. of the public health code.

The ARS sets up a CRAPS if necessary, with a view to providing its expertise and support to department prefects in the collection and processing of information relating to the heatwave.

The ARS is responsible for:

- coordinate the response of the healthcare system and ensure its constant adaptation (definition and organization if necessary of people's care channels, appropriate distribution of resources between departments, organization of management and distribution of product stocks health) ;
- centralize and process the available data on the situation of the health system and medico-social and the epidemiological situation;
- mobilize medical and scientific expertise as necessary;
- communicate to department prefects regional summaries and situation reports (produced on the basis of information collected by regional health services and authorities).

⁵ Formerly "extended white plan", modified by article 158 of law no. 2016-41 of January 26, 2016 on the modernization of our health system (article L. 3131-8 of the Public Health Code)

National Heatwave Plan 2017 The

CRAPS located in the capital of the defense and security zone ensures the interface between the health system and the Zone Operational Center (COZ).

The prefect

• Prefect of defense and security zone

The zone prefect takes the necessary coordination measures, analyzes the needs to be met and the additional resources to be deployed in the departments. In particular, he ensures the coordination of civil and military resources and can make available to one or more department prefects the State resources existing in the area when the event extends beyond a department. The zone prefect also constitutes the interface between the national level and the departmental level.

• Department Prefect

- Analysis of the situation

The department prefect analyzes the situation on the basis of the information at his disposal, in particular the vigilance card indicating an orange level, the information provided by the Météo-France extranet and the local conditions in connection with the main PNC actors (ARS, communities, etc.).

Where necessary, the ARS provides support with the expertise of the CIRE. To obtain any additional meteorological information, the prefect and the ARS also have access to the local meteorological center designated by Météo-France.

- Alert decision

The prefect decides to move his department to level 3 - heatwave alert. In the Paris department, the PNC is implemented by the police prefect and the prefect of the Ile-de-France region, prefect of Paris under their respective powers.

- Transmission of the alert

The prefecture transmits the prefect's decision to move to level 3 - heatwave alert according to the usual weather alert procedures, to the various stakeholders in the department listed in the PGCD and in particular to the ARS.

The vigilance monitoring bulletin and the Météo-France extranet dedicated to ARS and prefectures contain information that can be used by the prefecture to inform stakeholders about the deadlines and intensity of the expected heatwave phenomenon.

- Activation of departmental measures of the heatwave plan

The departmental PNC measures are defined in the PGCD, linked to the departmental ORSEC system. In this context, the prefect takes all useful measures to mobilize the necessary resources to manage the crisis and coordinate operations. The deployment of these provisions can take into account local intra-departmental specificities, in particular differences in climate, urbanization and population density, etc.

In addition to the heatwave alert, the prefect, where necessary, mobilizes the stakeholders concerned. The adapted measures provided for in the PGCD can be implemented in a graduated manner according to the analysis of the situation carried out by the ARS and the additional information available to the prefect (population gatherings, atmospheric pollution, etc.).

In particular, beyond the alert procedure, these include the following actions: • carrying out local information actions on basic preventive measures aimed at the public (via local media) or towards the various stakeholders . This

National Heatwave Plan 2017

- preventive information is, along with direct contact measures with vulnerable people, one of the keys to preventing the effects of heatwaves on people; • trigger the departmental mobilization plan⁶

- request the triggering of “white plans” (influx of victims into the health establishments) or “blue plans”; • mobilize structured associations at the departmental level; • ensure that all local public services and associated organizations are mobilized and ready to implement the planned actions:

- assistance to isolated elderly people by mobilizing SSIADs, SAADs and volunteer associations, in liaison with the Departmental Council and the municipalities as part of the triggering of the PAU for the benefit of elderly people and people with disabilities in the event of exceptional risks (“vermeil plan”); - reception of people at risk in cooled premises (supermarkets, public buildings, etc.) in liaison with the municipalities;

- organizational, operational and material supply measures to protect, cool and hydrate infants and young children.

- remind mayors of the importance of taking concerted action to assist and support isolated people to prevent the health consequences of a heatwave.

The prefect urges them to implement all the means at their disposal and invites them to let them know what reinforcements they would need, beyond their own means, so that all of these actions are carried out with all the necessary resources. necessary guarantees and efficiency. Municipalities can involve associations and organizations to contact elderly people and people with disabilities living at home. Water distribution points are installed, the hours of municipal swimming pools are extended, etc.

The prefect may ask mayors to communicate the nominative registers that they have created and regularly updated, in accordance with the provisions of articles R.121-2 to R.121-12 of the code of social action and families taken into account. application of article L.121-6-1 of the same code, listing elderly people and people with disabilities who have requested it.

The prefect takes all regulatory measures of limitation or prohibition adapted to the circumstances falling within his general administrative police powers.

In the event of a serious heatwave episode, the State representative may apply the provisions of article L.1435-1 of the public health code which provides that the services of the ARS are placed for use under the authority of the representative of the territorially competent State when an event involving a health risk may constitute a disturbance of public order.

Depending on local needs, the prefect relies on the ORSEC system (stakeholder alert system, activation of the COD, activation of a public information unit, etc.).

When the COD is activated, it brings together, as necessary, the representatives of the territorial stakeholders affected by the heatwave to coordinate their actions.

Exceptionally, depending on the territorial scale and/or duration of the phenomenon, the Prime Minister could be required to activate the CIC.

⁶ Formerly “extended white plan”, modified by article 158 of law no. 2016-41 of January 26, 2016 on the modernization of our health system (article L. 3131-8 of the Public Health Code)

National Heatwave Plan 2017

- Feedback of information

Feedback on measures implemented by prefectures and local authorities will be set up via the ORSEC portal. It concerns in particular the activation or maintenance of level 3 - heatwave alert for the department, the main measures implemented by local authorities or the activity of emergency fire services. This information must be provided no later than 5 p.m.

Any information specific to any event relating to the current heatwave episode (reporting of facts, situation updates, etc.) is also provided in the ORSEC portal. Situations other than health related to the heat wave (plant fire, drought, access to drinking water, transport, etc.) may also be the subject of a report.

- Communication Specific

communication actions are implemented from June 1 to August 31. They are described in sheet 1: communication.

Contacts designated by Météo-France

The interregional departments of Météo-France are the contact persons for the zone prefects and zone ARS. Their geographical competence corresponds to defense and security zones. The interregional weather forecast service which operates 24/7 will provide any additional information necessary to the zonal authorities. Web conferences or telephone conferences may possibly be organized to allow information to be shared between all of these entities.

Department prefects or ARS may obtain additional information if the need arises from the meteorological center designated as contact by Météo-France, which may be located in a neighboring department or may be the interregional directorate. following the organization of each interregional direction of Météo-France. These centers are open 12 hours during the day then their tasks are taken over at night by the interregional weather forecast service. Web conferences or telephone conferences may possibly be organized to allow information to be shared between all of these entities.

II. MAINTAINING OR RAISING LEVEL 3 - HEAT WAVE ALERT

1. Maintaining level 3 – heatwave alert

If the vigilance card becomes yellow or even green again but a health impact persists, the prefect may, in conjunction with the ARS, decide to maintain the adapted measures of the PGCD.

2. Lifting of level 3 - heatwave alert

When the meteorological and health situations no longer call for specific measures, the prefect decides, in conjunction with the ARS, to return to level 2 - heat warning or level 1 - seasonal monitoring. Information relating to the change in level is communicated via the ORSEC portal as well as to the stakeholders concerned.

National Heatwave Plan 2017

ANNEX

SHEET 11: LEVEL 4 - MAXIMUM MOBILIZATION

In the phase of worsening of the heatwave and/or the health situation, level 4 - maximum mobilization corresponds to red meteorological vigilance for the heatwave parameter.

All the elements detailed in sheet 10 in the event of level 3 - heatwave alert are applicable at a minimum and must be reinforced and adapted to the dimension of the situation when level 4 - maximum mobilization is triggered.

I. TRIGGER OF LEVEL 4 – MAXIMUM MOBILIZATION

1. At the national level

As specified in the circular of September 28, 2011 relating to the weather vigilance and alert procedure, “red” situations indicate a high risk of the occurrence of extreme phenomena that could lead to catastrophic consequences.

The decision to switch to red vigilance by Météo-France may take into account not only the exceptional values of the IBM, but other parameters evaluated with the support of vigilance partners (DGS, DGSCGC etc.) or the main operators allowing to assess the consequences in different sectors (drought, drinking water supply, saturation of hospitals or funeral operators, power outage, need to adjust working hours or stop certain activities, etc.).

Level 4 of the PNC, consistent with the red alert, corresponds to a proven exceptional heatwave, very intense and lasting, with the appearance of large-scale collateral effects. This situation requires the implementation of exceptional measures.

The crisis, becoming intersectoral, requires maximum mobilization and coordination of the State's response. Level 4 – maximum mobilization is triggered at the national level by the Prime Minister, on the advice of the Minister responsible for Health and the Minister responsible for the Interior. The Prime Minister can “entrust the operational management of the crisis to a minister whom he designates based on the nature of the events, the type of crisis or the political direction he intends to give to his action”.⁷ The designation of this minister “results in the activation of the CIC which brings together all the ministries concerned (...)”.

In the event of heatwave episodes and in particular activation of level 4 - maximum mobilization, it could be considered to resort to the mobilization of the health reserve, for example to reinforce already overloaded care or medico-social structures.

⁷ Circular of January 2, 2012 relating to the government organization for the management of major crises.

National Heatwave Plan 2017

2. At the local level

The prefect

ÿ Prefect of defense and security zone

It is up to the prefect of the defense and security zone to be the preferred interlocutor at the national level and to ensure the coordination of departmental efforts both in terms of reinforcements and communication. The zone prefect takes the necessary coordination measures described at level 3 - heatwave alert, adapted to the size of the situation.

ÿ Department prefect

On a proposal from the CIC, the Prime Minister may ask the department prefects concerned to activate the maximum level of mobilization.

Department prefects may also propose activating the maximum level of mobilization based on meteorological data, health data or unusual activities of their services, and the observation of ancillary effects (drought, electrical breakdowns or load shedding, saturation hospitals...).

At level 4 - maximum mobilization, the department prefects arm the CODs, ensuring that they include all the services involved in the implementation of general population protection measures (health aspects, civil security aspects, water supply, in energy,...) and a point of contact with elected officials.

The prefects also ensure that they coordinate the messages disseminated by the local authorities in their department, maintain a bond of trust and proximity with the populations and monitor public opinion.

The ARS

The ARS organizes itself at the local level and sets up, where necessary, a CRAPS in the health and medico-social field described in sheet 10: level 3 - heatwave alert.

II. MAINTAINING OR RAISING LEVEL 4 - MAXIMUM MOBILIZATION

1. Maintaining level 4 - maximum mobilization

When temperatures drop, the maximum mobilization level may be maintained for reasons other than meteorological reasons while the vigilance card will be a color other than red.

2. Lifting of level 4 - maximum mobilization

The lifting of the system is decided by the Prime Minister, on the basis of information provided by the CIC. This decision is communicated to the departments and stakeholders concerned.

National Heatwave Plan 2017

ANNEX

SHEET 12: DEPARTMENTAL DECLINATION OF THE PNC

I. DEPARTMENTAL HEAT WAVE MANAGEMENT PLAN (PGCD)

On the basis of the PNC in particular, the department prefects update the PGCD which describes the entire system deployed according to the activation levels of the plan, specifying the role of each of the public and private territorial actors. The PGCD is linked to the departmental ORSEC system.

II. MEETING OF THE ACTORS

The department prefect may bring together before June 1 , and if necessary at the end of the season, the local stakeholders concerned by the PNC, in particular through a Departmental Heatwave Committee (CDC) or other consultative bodies with a health vocation.

This meeting brings together in particular the services of the prefecture, the ARS, the DDCSPP, the rectorate, Météo-France, the president of the Departmental Council and the mayors of the main municipalities of the department.

For questions relating to the care of vulnerable people, this meeting also brings together representatives of the following institutions: social and medico-social establishments, SSIAD, SAAD, CLIC, social security organizations, representatives of associations signatories to the framework agreement (notably the French Red Cross and associations of mobile teams such as "SAMU social").

For the organization of ongoing care, CODAMUPS is called upon.

The objectives are:

- evaluate and update the departmental system for managing a heatwave in accordance with the PNC with all the stakeholders concerned and organize, if necessary, exercises to test its effectiveness;
- ensure that health establishments and establishments welcoming the elderly and people with disabilities have white plans and blue plans respectively;
- take stock of training and awareness-raising actions for different populations at risk and relevant actors at the local level;
- ensure that the recommendations are disseminated to the populations risks;
- prepare a departmental communication plan in the event of an alert and strong heat;
- make an annual assessment of structural measures to combat heat waves, particularly in health and medico-social establishments and those housing people with disabilities;
- carry out an assessment at the end of the season of the effectiveness of the measures taken during the summer.

In addition, before the summer, the prefect can bring together or inform the mayors in order to discuss good practices in terms of assistance and support for isolated people, in particular on: - registration

measures on the register nominative register identifying elderly people and people with disabilities who request it (articles R. 121-2 to R. 121-12 of the Social Action and Families Code) and the use of this data.

National Heatwave Plan 2017

Furthermore, the prefect automatically authorizes mayors to communicate directly to local operational services data relating to people registered in the register, but requesting that this transmission be limited to elements strictly necessary with regard to the technical and geographical scope of the stakeholders. .

It is appropriate, in fact, whatever the context, to ensure respect for the confidentiality of data and their use within the sole framework of support and assistance actions as provided for by article L.116-3 of the code of social action and families:

- the identification of air-conditioned places to accommodate people at risk living home ;
- the intervention of associations and organizations to contact elderly people and people with disabilities living at home;
- the establishment of water distribution points, the extension of opening hours municipal swimming pools etc.

National Heatwave Plan 2017

ANNEX

SHEET 13: MONITORING AND EVALUATION COMMITTEE OF THE NATIONAL HEAT WAVE PLAN AND THE NATIONAL GUIDE FOR PREVENTION AND MANAGEMENT OF IMPACTS HEALTH AND SOCIAL ASSISTANCE LINKED TO COLD WAVES (CSEP)

Monitoring and evaluation of the PNC is carried out by a Monitoring and Evaluation Committee of the National Heatwave Plan and the national guide for the prevention and management of health and social impacts linked to cold waves (CSEP).

I. MISSIONS

The committee's missions are:

- to ensure the implementation, on the one hand at the national level and on the other hand of the variation at the local level, of the structural, organizational, information and communication measures contained in the PNC and in the guide national prevention and management of health and social impacts linked to cold waves;
- to identify the difficulties encountered in the field;
- to ensure the evaluation of these documents, in particular on the structural and organizational measures implemented in at-risk establishments as well as on the assessment of training and awareness-raising actions for the various populations at risk and stakeholders concerned;
- to propose, depending on the evolution of the context and the aforementioned evaluation, adaptations to the content of these two documents;
- organize national exercises to test their effectiveness.

II. COMPOSITION

The committee is chaired by the Director General of Health or his representative.

The committee is made up of representative(s):

- ministries responsible in particular for: health, social affairs, the interior, labor, national education and higher education, youth and sports, defense, justice, environment, agriculture, etc.; - health safety agencies: ANSP, National Agency for the Safety of Medicines and Health

Products (ANSM), National Agency for Health, Food, Environmental and Occupational Safety (AnSES), ANSP, National Agency Public Health (ANSP);

- national organizations: Météo-France, Nuclear Safety Authority (ASN), Institute Radiation Protection and Nuclear Safety (IRSN);
- Regional Health Agencies (ARS);
- health professionals: National Council of the Order of Physicians (CNOM), National Council of the Order of Pharmacists (CNOP), Federation of Hospital and Private Assistance Establishments (FEHAP), French Hospital Federation (FHF), Private Hospital Federation (FHP), French Society of Geriatrics and Gerontology (SFGG), French Society of Emergency Medicine (SFMU), SAMU Social de Paris (SSP), College of general medicine, Society French General Medicine (SFMG) and people specializing in the topic;

National Heatwave Plan 2017

- associations and federations: Association of Mayors of France (AMF), Assembly of Departments of France (ADF), French Red Cross, France Bénévolat, Order of Malta, Little Brothers of the Poor, Union of Young Workers' Homes (UFJT), Social Union for Housing (USH), National Union of Municipal Social Action Centers (UNCCAS), National Inter-Federal Union of Private Health and Social Works and Organizations (UNIOPSS), National Federation of Host and Social Associations social reintegration (FNARS), Federation of social SAMU...

Each organization is represented by one person.

III. OPERATING MODALITIES

The CSEP meets at least twice a year:

- after the winter season and therefore before the summer season: to analyze the events occurring over the winter period and evaluate the national guide for the prevention and management of health and social impacts linked to cold waves and present the PNC before the summer period.
- after the summer season and before the start of the winter season: to analyze the events occurring during the summer period and carry out an evaluation of the PNC and to present the national guide for the prevention and management of the health and social impacts linked to waves of cold which will be declined locally.

Concerning the committee meetings, the summaries communicated to the DGS by the ARS or even by other actors (Météo-France, ANSP, etc.) will enrich the committee's thoughts on possible developments in the systems. This meeting will also be an opportunity to allow field stakeholders to present their findings.

The DGS provides the secretariat of the committee.

National Heatwave Plan 2017

ANNEX

SHEET 14 : FEEDBACK

Following the occurrence of a heatwave or extreme heat event, feedback is organized at national level with all stakeholders. It is based in particular on information collected at the territorial level (prefecture, SIDPC, ARS, DIRECCTE, DDCSPP, Météo-France, ANSP, etc.).
