READING GUIDE

Click it to go to the main menu

Welcome to the Local Heat Plan Guidance, version 2.0. Commissioned by VWS and the RIVM, this guidance was written by a project group of GGD professionals on behalf of the national GGD Climate & Health working group, in collaboration with consultancy and engineering firm TAUW (see [colophon](#)).

This document can be navigated in various ways. The following tips will help you find the right information.

- The guidance has been developed for municipalities and professionals who do not yet have a local heat plan and are new to the subject, as well as for municipalities or professionals who have already started working on the development and implementation of a local heat plan in recent years.
- The guide is structured so that you can navigate to the information that is relevant to you. On every page, you can return to the main menu via the thermometer icon. The chapters are independent of each other and refer to one another where necessary.
- Where possible, the guidance refers to relevant information. In addition to links in the text, we also use clickable buttons with a link behind them. This can be recognized by the hand icon that appears when you hover the mouse over the button.

- The step-by-step plan for the development of a local heat plan, including the accompanying forms, can be [downloaded separately](#).
- The overview with examples of actions and communication materials provides good insight into what is available. However, developments are rapid, and the overview is therefore never complete. Unfortunately, for a number of target groups, examples do not yet exist or materials still need to be developed. The guide will be updated annually with new information.

INTRODUCTION

This guidance document constitutes an explicit invitation to all municipal partners (healthcare, welfare, and housing organizations, as well as municipalities and Public Health Services) to draw up or further develop a local heat plan. The risks of (extreme) heat are relevant to regions in the Netherlands and are expected to increase in the future, as shown in the [KNMI'23 climate scenarios](#). It is important to emphasize that heat is not only a problem in cities. Health risks also occur [in smaller communities and rural areas](#) during warm periods, exacerbated by an aging population and other demographic and spatial developments. This interplay of factors is explained in the ['Heat Power' and 'Heatfit' models](#).

Risks and effects of heat

Prolonged heat can cause serious health problems, especially among vulnerable groups. The elderly, particularly those over 75, are at the greatest risk of heat-related health issues. People with chronic conditions, young children, homeless people, people with mental health conditions, outdoor workers, people with intellectual disabilities, refugees, and pregnant women are also particularly vulnerable. People living in homes that are too hot or who lack the (financial) means to adapt to the heat are at increased risk. This often occurs in neighborhoods with a high percentage of residents with a low Socioeconomic Position (SEP). Additionally, participants in intensive outdoor activities or [\(sports\) events](#) may experience health effects such as overheating or dehydration.

Although mortality due to heat has decreased since 2010 due to increased awareness and adjustments in healthcare, the risk on extremely hot days remains significant. During the record heatwave in 2019, when temperatures in the Netherlands reached 40 degrees for the first time, nearly 150 more people died than on an average summer day. Hospitals and general practitioners reported an increase in the number of patients during heatwaves, often due to dehydration, heatstroke, or the worsening of pre-existing conditions.

In addition to heat stress, other health risks also play a role, such as the combination of heat and air pollution (summer smog) or pollen, which place an extra strain on the respiratory system and lead to the worsening of chronic diseases such as cardiovascular disease. Every year, thousands of people experience discomfort or symptoms during warm periods, while healthcare providers and loved ones are burdened with extra care for vulnerable individuals. Increasing population aging and climate change make it all the more urgent to strengthen local policies and preventive measures.

Increase in problems The aging population

is putting increasing pressure on the healthcare system. In the Netherlands, there are currently over 1.5 million people aged 75 and older, and this number is expected to rise to more than 2.1 million by 2030. Within this group, a significant proportion experiences feelings of loneliness: according to recent figures, over 50% of those over 75 feel lonely, which amounts to more than 750,000 elderly people. During periods of prolonged heat, the combination of high temperatures and social isolation can pose serious health risks.

Older people who feel lonely often have less access to help, information, or cooling, making them particularly vulnerable to dehydration, overheating, and complications from pre-existing conditions. Additionally, informal caregivers and family members are on vacation precisely during the summer period, meaning potential help and support are even less available. This double vulnerability calls for targeted preventive measures and local collaboration between municipalities, Public Health Services (GGDs), and healthcare and welfare partners.

In addition, the number of extremely hot days in the Netherlands has increased sharply over the past century as a result of climate change. Tropical days, on which the temperature in De Bilt reaches 30°C or higher, occur four to five times as often today as around 1900: on average between 2 and 8 days per year, depending on the region. In warm years such as 2018, 2019, and 2020, that number rose to more than ten tropical days in De Bilt, with regional peaks exceeding twenty. The number of extremely hot days will increase in the coming decades. The intensity of heat in the Netherlands is also increasing, as evidenced by an average temperature rise of approximately 2.3 degrees Celsius since 1901 in De Bilt.

1. PURPOSE AND TARGET GROUP OF THE GUIDELINES

PURPOSE AND TARGET GROUP OF THE GUIDELINES

The Ministries of Health, Welfare and Sport (VWS), Housing, Spatial Planning and the Environment (VRO), and Infrastructure and Water Management (I&W) have in the 'Heat Approach 2025' identified the following ambition, which can be translated into the goal of this guideline:

From 2026, developing a local heat plan will be easier for municipal partners thanks to the updated Handbook on Local Heat Plans. By 2028, the number of local heat plans in the Netherlands will have doubled. Support is available for improving existing plans.

The task is therefore threefold:

1. For municipalities without a local heat plan: facilitating the development of a local heat plan.
2. For municipalities with a local heat plan: provide information, inspiration, and support for the further development and improvement of the existing plan.
3. A doubling of the number of municipalities with a local heat plan.

Objectives • To

increase the number of municipalities in the Netherlands with a local heat plan.

- Improving and ensuring the implementation of the National Heat Plan at the local level.
- Improving and securing the development and implementation of new and existing local heat plans.
- Improving and securing cooperation between climate adaptation and the social domain, and the involvement of health promotion professionals at Municipal Health Services and local partners.
- Strengthening care chains and distributing tasks among all involved organizations, and preventing overlap in activities.
- Providing a reference work and basis for the development and updating of a local heat plan by municipalities together with regional and local partners.
- Providing aggregated information (examples, references), aimed at the most important target groups and the people who have contact with them. • Sharing knowledge in the field of heat and health, and in the field of effective communication regarding this.

Target group

This guide is written for a diverse group of municipal officials and professionals at social organizations committed to protecting the health of (vulnerable) residents. The initiative for a local heat plan can be taken from various domains, such as climate adaptation, public health, or elderly policy. A local heat plan is not mandatory for municipalities, but it is strongly recommended. This also aligns with the responsibilities as outlined in the Public Health Act and the Environment and Planning Act. Municipalities are the logical owners of the local heat plan, but other organizations can also take the first step and be closely involved in the development of the plan. Examples include the Municipal Health Service (GGD), the Environmental Service, care organizations, welfare organizations, housing corporations, or other local partners committed to vulnerable target groups. This leads us to the following list of target groups:

Welfare professionals

- Elderly care consultants
- Activity supervisors
- Community workers
- Social workers
- Housing consultants
- Social organizations
- Community centers

Healthcare professionals

- District nurses
- Care pathway coordinators
- General Practitioners
- Practice assistants
- Psychologists
- Employees of mental healthcare institutions
- Pharmacists
- Day activity supervisors

GGD professionals

- Health promoters
- Environmental & Health Consultants
- Policy Advisors
- Pediatricians and nurses
- Staff at the Special Care hotline

Municipal officials

- Public Health • Social Development
- Social domain
- Climate adaptation
- Elderly policy
- Healthy living environment

2. WHAT IS A LOCAL HEAT PLAN?

2.1

Description and
objectives

2.2

Heat instruments and national climate
adaptation policy

2.3

Cooperation and
strengthening
mutual self-reliance

2.4

Linkage with existing network and
chain approaches

2.1 DESCRIPTION AND OBJECTIVES

Local heat plans describe, at the municipal level, which measures prevent health risks associated with heat. This applies both prior to the summer season (primary prevention) and during a hot period (primary and secondary prevention). A local heat plan is intended for individual caregivers and healthcare professionals, care institutions, and social organizations that collaborate with and/or are connected to vulnerable target groups. The plan contains references to clear information regarding heat-related risks and offers tools to prevent health damage.

In line with the National Heat Plan's warning system, municipalities, Public Health Services, and local partners can define their own assessments and actions during heatwaves to strengthen the social infrastructure.

The local heat plan describes objectives and agreements regarding preventive information, communication, and support, specifically aimed at vulnerable residents. In addition, the plan documents what is already happening in a municipality. This is done to learn from each other and to identify blind spots.

Coordination and documentation of tasks in the various phases

The local heat plan is implemented in annual cycles, with four phases. For each phase, agreements and the division of roles between the municipality, the Public Health Service (GGD), and other partners are established: the preparation phase, the pre-warning/information phase, the warning phase, and the evaluation and improvement phase.

In addition, ongoing agreements are made regarding knowledge development and sharing, and regarding preventive measures such as facilitating healthy behavior. [Click here](#) for a detailed elaboration of the agreements in the various phases.

Collaboration with local partners

To achieve the goals of the local heat plan, collaboration with local partners is indispensable. Therefore, it is an important part to seek out collaboration with local partners and describe this in the heat plan. The level of detail at which this is included may vary.

Existing care and welfare networks can often be utilized for this purpose, which can facilitate the development and updating of the heat network.

Objectives of a local heat plan

- Preventing, mitigating, and addressing heat-related health and well-being problems, illness, and mortality.
- Promoting self-reliance and mutual support during heat.
- In the region concerned, municipalities define how they will carry out coordinated tasks and activities in preparation for hot periods and during the activation of the National Heat Plan. This is done in collaboration with regular partners, including the Municipal Health Service (GGD), the Regional Health Emergency Organization (GHOR), and other (social) organizations, the Red Cross, and local organizations in the fields of welfare, care, and housing. In this way, they can reach people with vulnerable health and provide support during prolonged heat.
- Providing a platform for the exchange of knowledge and experience involved local organizations, with the aim of improving care and support for vulnerable residents in the municipality or region.
- Creating structure and systematicity. This clearly defines the tasks and responsibilities between the organizations involved.

2.2 HEAT INSTRUMENTS AND NATIONAL CLIMATE ADAPTATION POLICY

Local Find Plan

- The translation and elaboration of the National Heat plan at municipal or regional level. • Describes concrete agreements between Municipal Health Services (GGDs), local partners (healthcare, welfare, housing corporations), and the municipality regarding primary and secondary prevention.
- Focuses on specific target groups, timelines, communication tools, and modules (prevention, information, support).
- Goal: To make independent assessments regarding warning and intervention strategies, appropriate to local vulnerabilities and resources, to prevent health problems during prolonged heat.

National Search Plan

- Prepared in 2007 (updated in 2015) by VWS and RIVM.
 - A national communication and warning system for heat alarms. • Focuses on providing information to healthcare professionals and risk groups via RIVM, KNMI, and industry associations. • Goal: health problems caused by
- Prevent prolonged heat by issuing timely warnings for extremely hot weather.

Heat Management Menu (process)

- The Heat Menu provides a comprehensive overview of the effects of heat and measures that municipalities can take, with references to relevant documents.
- The accompanying approach offers a detailed step-by-step plan • Divided into three domains: Health, Building and Area
- Goal: forming a local heat network and the drafting an Integrated Heat Action Plan

Integrated Heat Action Plan (product)

- Result of the Heat Approach Menu • Provides insight into what organizations within a municipality are already doing regarding heat • Contains concrete adaptation measures for the
- Area, building, and health domains for the short and medium term (1.5 – 2 years). A local heat plan can be a specific measure as part of the Health approach. • Describes which heat effects and/or measures from the Heat Menu have been prioritized together with partners. • Goal: an action plan with clearly assigned roles, budgets, and timelines that is reviewed annually.

National Adaptation Strategy

Within the [National Adaptation Strategy \(NAS\)](#) Extreme heat is explicitly addressed as one of the main climate risks alongside water safety, drought, and extreme precipitation. The NAS focuses on an integrated approach to heat adaptation, in which the national government, provinces, municipalities, and civil society partners collaborate within four thematic lines: area, building, health, and emergencies.

National Health Policy Memorandum 2025-2028

Every four years, the Minister of Health, Welfare and Sport publishes the [Health Policy Memorandum](#). with the challenges and priorities in the field of public health and prevention. The current memorandum contains five main themes: growing up with opportunities, reducing health disparities, mental health, vital aging, and a healthy living environment. Heat stress is identified as a key area of focus for three of the five themes.

2.3 COLLABORATION AND STRENGTHENING RELIABILITY

Collaboration with local partners

To achieve the goals of the local heat plan, cooperation between local partners is indispensable. Specifying the cooperation and coordination with these local partners is therefore an integral part of the local heat plan. The level of detail at which this is included may vary and, in the initial phase, may also be addressed at a cross-municipal or regional level.

Cross-domain collaboration

An effective local heat plan requires collaboration between various domains: care, welfare, housing, public health, and the social domain. Ideally, this should be done by aligning with existing networks and programs. This facilitates the development and maintenance of a heat network and allows vulnerable target groups to be better reached. Beyond the local heat plan, collaboration is also sought with the physical domain, for example during the development of an Integrated Heat Action Plan.

Strengthening mutual self-reliance

An effective local heat plan also increases the ability of residents to actively support each other in taking measures against heat stress. As a result, heat-related health problems are prevented and professional emergency services are relieved, particularly among more vulnerable individuals.

This includes, for example:

- Supporting each other in keeping the home and body cool. For example, by assisting with (sufficient) fluid intake and taking over necessary tasks that require physical exertion.

- Recognizing and acting appropriately in case of heat-related health problems and, if necessary, seek professional help.
- Creating and opening up cool spaces for people for whom it gets too hot at home or for people who are homeless.

In the [RIVM video about heat](#) is this summarized by the sentence:

Take care of each other; during hot weather, pay extra attention to people in your surroundings who could use help.

Within the local heat plan, it is important to specify who these people are, what can be done, and by whom.

Who can contribute to self-reliance?

Caring for others applies to everyone; every person is part of one or more networks within the family, neighborhood, or organizations. This also includes online networks, such as neighborhood apps. In particular, it concerns people who, even outside the heatwave, are informal caregivers for people belonging to vulnerable groups.

In the work environment, employers in particular have a responsibility regarding the health of people who work outdoors and/or perform heavy physical labor. Industries or organizations where clients reside have a responsibility towards both their staff and their clients.

Cultural, religious, and recreational facilities such as churches and mosques, museums, libraries, and swimming pools can also make an important contribution. They can lower the barrier to access for specific groups, extend opening hours, and provide additional facilities for cooling off.

2.4 LINKING WITH EXISTING NETWORK AND CHAIN APPROACHES

In the development and implementation of local heat plans, it is possible to explicitly align with the goals, structures, and **effective elements** of existing local network and chain approaches. Many of these approaches focus on the same vulnerable target groups. Examples include: One Against Loneliness, the fall prevention chain approach, Wellbeing on Prescription, Promising Start, and initiatives surrounding Healthy and Vital Aging. By connecting with such approaches, the emergence of new, parallel structures is prevented, separate interventions are combined, and optimal use is made of existing partnerships, lines of communication, and relationships of trust with professionals and residents.

This increases the collective impact.

Effective elements of existing network and chain approaches

1. Multidisciplinary collaboration Joining forces between the municipality, the Public Health Service (GGD), healthcare and welfare organizations, housing corporations, and volunteers increases effectiveness. Quick win: Align the local heat plan with existing neighborhood teams, networks, or coalitions such as “Healthy and Vital Aging,” “Dementia-Friendly Municipality,” and “Promising Start,” so that partners can respond immediately to heat warnings without the need for an additional consultation structure.

2. Early detection and proactive approach Vulnerable residents are identified and approached in a timely manner, for example via general practitioners, district nurses, neighborhood coaches, dementia consultants, or volunteer networks.

3. Personal message and customization Connecting with the residents' everyday lives increases effectiveness. Quick win: Link a heat message to existing home visits by volunteers, district nurses, or informal caregivers, for example within “One against loneliness” or the “chain approach to fall prevention,” or connect with local initiatives organized by older people themselves (village tables, senior associations, neighborhood activities).

4. Integrated approach

Heat can be smartly linked to other themes such as loneliness, housing quality, and health promotion. Quick win: Integrate short questions about heat into existing well-being conversations or intake interviews for debt counseling or housing support.

5. Sustainability and preventive approach

Structural safeguarding prevents ad-hoc measures. Explicitly include heat prevention in municipal policy; consider the housing and care vision, health policy, and neighborhood-oriented programs.

6. Stigma-free and positive communication. A

connecting message lowers barriers and encourages self-reliance. Quick win: Use recognizable campaign slogans such as “Stay cool through the summer together” and promote them jointly.

Examples of existing networks

Not every network reaches the same target group. For the implementation of heat plans, it is important to distinguish between networks that primarily reach residents and networks that mainly mobilize professionals. Both types of networks play a crucial role in preventing heat stress and protecting vulnerable target groups.

Networks with direct contact with residents

Utilize the existing connections

One against loneliness: Volunteers and welfare organizations reach (single) elderly people; heat messages can be integrated into existing home visits or phone calls.

Dementia-friendly municipalities: Local networks surrounding people with dementia, case managers, and informal caregivers can identify when someone is at risk and ensure appropriate support.

Wellbeing on Prescription: Reaches people with a small social network through wellbeing activities; offers opportunities for accessible dissemination of information.

Aging healthily and vitality: Networks and activities aimed at the elderly offer structured contact opportunities where preventive information about heat can be included.

Regular walk-in and meeting places: by aligning with trusted places such as (senior) associations, churches, mosques, community centers, drop-in centers, night shelters, food banks, and libraries, there is a greater chance that residents will feel called upon and actually take action in response to heat warnings.

Energy coaches: Energy coaches are volunteers who provide residents with free and independent advice on making their homes more sustainable and saving on energy bills. They offer personal advice, often at home, on measures such as insulation and making the home more sustainable, and provide information on available subsidies and energy-saving products. Advice on making the home heat-resistant can also be added to this.

Professional networks

Coordination and scaling up via professionals

Chain approach to fall prevention: Professionals such as general practitioners, physiotherapists, and district nurses work with the same target group as in heat plans; collaboration promotes self-reliance and early detection.

Promising Start: Reaches young families through healthcare professionals; pregnant women and babies are particularly sensitive to heat.

Social neighborhood teams: A social neighborhood team offers local residents accessible help and support with questions regarding care, well-being, parenting, money, housing, work, and social problems, so that people can continue living at home and participate in society for as long as possible.

Local heat and health coalitions/networks: Focused on collaboration regarding heat stress; suitable for coordinating measures such as cooling points and communication campaigns.

3. PHASES, PARTIES, AND TASKS

3.1 Organization and phases

3.2 Parties involved

3.3 Tasks and roles

3.1 THE PHASE

Preventing and addressing public health problems during heat involves several phases: preparation, activation, and execution. An evaluation always forms the bridge to the next year, in which the same phases are gone through.

March and April	Mei t/m september				October t/m February
Preparation phase	Pre-warning / information phase	Warning phase			Evaluation and improvement phase
• Implementing improvements following evaluation • Kick-off of preparations for local partners (heat network preparation session) • Make available communication materials (online and offline) for local partners • Preventive communication- and awareness campaigns by municipal partners	• Distribution of information email RIVM (from the Municipal Health Service or municipality) among local organizations • Preventive communication- and awareness campaigns by municipal partners	Code yellow • Distribution of warning email RIVM (from the Municipal Health Service or municipality) among local organizations • Communication via canals municipality, GGD and local partners • Additional actions and support for vulnerable target groups by local care and welfare partners	Code orange • Distribution of warning email RIVM (from the Municipal Health Service or municipality) among local organizations • Communication via municipal channels, GGD and local partners • Additional actions and support for vulnerable target groups by local care and welfare partners	Code red • Distribution of warning email RIVM (from the Municipal Health Service or municipality) among local organizations • Follow up on actions as set out in the extreme heat action plan (if available) • Crisis plan kicks in possibly in operation	• Organize meeting with local partners • Optional: Distribute questionnaire • Gathering points for improvement • Coordination between involved municipal partners
Prevention	Communication and information campaigns before heat occurs. Continuous development and sharing of knowledge.				

3.2 PARTIES INVOLVED

Those involved

The execution of tasks takes place primarily at the local level, requiring all partners and stakeholders to address the preparations and execution in a timely, adequate, and joint manner. This guidance serves as an urgent invitation to do so and offers the necessary starting points.

The organizations to be distinguished are:

- Locally responsible authorities, such as municipalities, Public Health Services, Safety Regions, and administrative officials responsible in the healthcare and social sectors and housing sector.
- Healthcare and social care providers at institutions such as residential and nursing homes, district nursing, and home care, daycare centers, community centers and social base.
- Local community, social work, family care, informal care, and general population.

Partners and implementers

Locally, different parties are in charge than nationally: district nurses, general practitioner practices, social neighborhood teams, community centers, social organizations, pharmacies, elderly care, the municipality, home care organizations, geriatric networks, welfare foundations (elderly consultants, informal care support), senior associations, partners in the National Coalition against Loneliness, and local branches of national organizations, such as the Salvation Army, De Zonnebloem, and the Red Cross.

Multiple organizations are involved in carrying out assistance tasks before or during a heatwave. The municipality, the Public Health Service (GGD), local organizations focused on vulnerable residents, and **sports and event organizers**: they all have a responsibility in preparing for social protection during a heatwave.

During a heatwave, it is important that not only professional care providers but also informal caregivers (family caregivers, such as family members, friends, and neighbors) pay extra attention to, and where necessary provide care to, vulnerable and non-vulnerable people.

self-reliant people in their local area. A local heat plan can alert institutions, care providers, and volunteers in a timely manner to a period of sustained heat and offer practical guidance. This enables them to take timely measures to provide good care to people with vulnerable health and help manage the health risks of sustained heat. This guide contains references to informational materials that can be of service in this regard.

3.3 TASKS AND ROLES

Tasks and division of tasks

One of the core objectives of the Local Heat Plan Handbook is to identify a range of tasks that can be performed during a heatwave by various organizations, including professionals and the general public, among others, informal caregivers.

They can use information included in this guidance document when preparing and elaborating on these tasks. The following pages contain an overview of tasks during the preparation phase, the pre-warning phase, and the warning phase.

[Click here for a comprehensive overview of tasks and task distribution per phase.](#)

Role of municipalities

The municipality takes the lead on the local heat plan, and thereby has the role of organizing, stimulating, and facilitating the local approach to heat.

This is, of course, done in close cooperation with the local partners.

Role of the province

Given that the national heat plan can also be activated for specific provinces, a role for the province in the planning and implementation of the heat plan is conceivable. A province can, preferably in cooperation with the Municipal Health Service (GGD), encourage the drafting of a local heat plan as part of climate adaptation or health policy. In addition, the province has a task in ensuring a healthy physical living environment, including climate adaptation and combating heat-related nuisance.

Role of health services

The GGD is the municipal health service that provides various forms of public health care. The GGD can play a central role in the local planning and implementation of the heat plan. However, this depends on the organization and mandate from the municipality. The GGD can, among other things:

- As a process facilitator, support municipalities in drafting and organize and coordinate collaboration with local partners;
- Provide insight into the networks and care surrounding target groups vulnerable to heat;
- Utilize her own contact moments with citizens to provide individual information to, for example, parents of young children via the youth health care, childcare locations via the Childcare Inspectorate or the homeless via OGGZ;
- Providing information to professionals, volunteers, and residents on combating heat stress;
- Monitor and evaluate the deployment and implementation of the local heat plan.
- Advising on inquiries from municipalities, citizens, and social partners such as schools and healthcare organizations.

4. STEP-BY-STEP PLAN AND CYCLE FOR THE LOCAL HEAT PLAN

4.1 Step-by-step plan for developing a local heat plan

4.2 Cycle of implementation, evaluation
and further development of the local heat plan

4.1 STEP-BY-STEP PLAN FOR THE DEVELOPMENT OF A LOCAL HEAT PLAN

On this page, we present a 4-step plan for developing a local heat plan.

Step 1 focuses on preparation, including forming a core team, dividing tasks, and planning a kick-off meeting.

Step 2 describes activating the core team, identifying vulnerable target groups and relevant organizations, inviting partners to a networking meeting, and starting with the input form.

Step 3 focuses on the consultation with the heat network: discussing experiences, determining actions and responsibilities, and drafting a concept local heat plan.

Step 4 covers the written feedback round and the finalization of the local heat plan, including possible administrative adoption, publication, and media engagement.

Input forms have been added to the various process steps during the drafting of the local heat plan, which can be used as a tool.

[Click here for the written step-by-step plan](#)

Step-by-step plan for developing a local heat plan

1. Core team preparation

- Setting up core team
- Schedule kick-off meeting

2. Activation of core team

- Division of roles and expectations
- Target groups and relevant organizations in the heat network

3. Heat network consultation

- Heat network meeting

4. Feedback and documentation

- Feedbackronde
- Recording

4.2 CYCLE IMPLEMENTATION, EVALUATION AND FURTHER DEVELOPMENT OF THE LOCAL HEAT PLAN

On this page, we describe the annual cycle in which the local heat plan is implemented, evaluated, and further developed. Because the heat plan is a dynamic document, it goes through four phases each year that partially coincide with the phases described in Chapter 3.1.

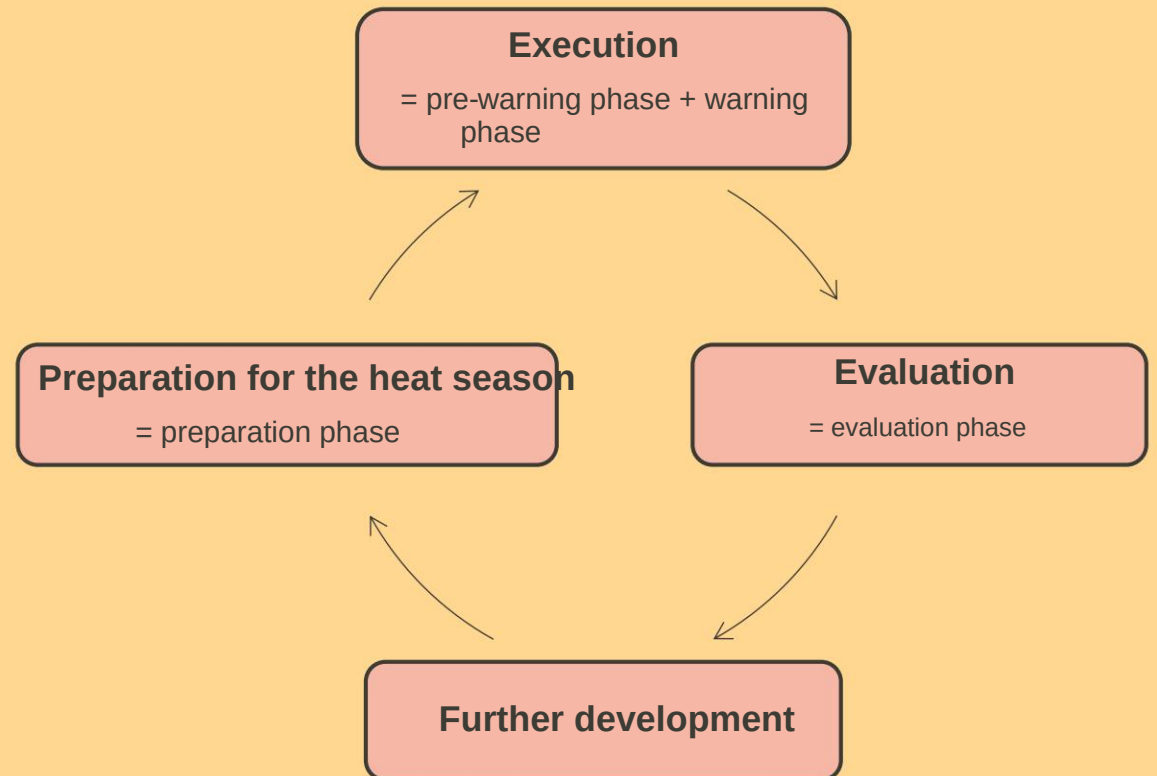

Implementation - During periods of heat, all involved organizations carry out the actions outlined in the local heat plan. The plan is activated as soon as the National Heat Plan is announced or when local conditions require it. Organizations monitor their own actions and progress.

Evaluation – After the summer, the heat coordinator will organize an evaluation meeting with the heat network. The meeting focuses on reviewing the implementation, assessing completed and uncompleted actions, and identifying possible improvements. It will also be examined whether all target groups and relevant organizations have been sufficiently involved.

Further development – The heat coordinator updates the local heat plan based on new national insights and the evaluation. Actions are adjusted or supplemented, and missing target groups or organizations are added. Organizations within the heat network also update their own heat protocols.

Preparation for the heat season – In the spring, the heat network meets again for a preparatory meeting. The heat plan is reviewed step by step as a dress rehearsal and checked for currency. All involved parties assess whether they are ready for implementation during the upcoming summer.

5. MODULES: TARGET GROUPS, PARTNERS AND ACTIONS

MODULES: TARGET GROUPS, PARTNERS AND ACTIONS

Further developing and expanding an existing local heat plan can feel complex due to the many choices involved regarding target groups, municipal partners, and communication and information campaigns. Modules offer a solution: they allow a municipality to expand the heat plan in a structured and step-by-step manner, without the process becoming unmanageable. On the following pages, you will find an overview of example modules for inspiration that you can add to the local heat plan for each target group.

**5.1 Older people

5.8 Refugees

5.9 Pregnant women

5.1 INDEPENDENTLY LIVING AT HOME ELDERLY 75+

Communication

Distribute flyers and posters

Contact your local GGD for communication materials. See the example for [GGD Zuid- Holland Zuid](#). A [hot days map](#) and [water map](#) are available. These provide information on what to do in hot weather and encourage you to drink plenty of water. For recognizing symptoms, see the flyer [Local Heat Plan | GGD North and East Gelderland](#).

Information on social media

For social media posts, information from [GGDleefomgeving](#) can be used. the [Red Cross](#) and [RIVM](#). These [websites](#) can also be referenced in [online posts](#). [Click here](#) for some examples.

Disseminate information via partner newsletters and websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Scorching Hot Bingo – No Need to Worry!

This is an activity provided by the Red Cross. The No Emergency! training covers various themes, including heat.

When creating the local heat plan, it is important that a party is made responsible for organizing this information. That party then contacts the Red Cross in the spring to organize these training sessions. Consequently, these training sessions are **not** held during the heatwave, but rather in the period leading up to it, as preparation. The Red Cross arranges the trainers and the content of the training. The other party, for example a welfare organization, handles the surrounding organization, such as a location with screens and sound, recruitment, catering, and decoration.

The costs are a 35 euro expense allowance for the Red Cross.

Theme meeting

The municipality can organize information sessions on the topic of heat for the elderly in collaboration with partners such as the GGD, the Red Cross, and potentially home care organizations and general practitioners/pharmacists. This meeting focuses on conveying information about heat and what to do in case of overheating. Additionally, there is an opportunity to connect people with each other for assistance tasks. [An example presentation can be found here.](#)

Support

Extra home visits

For checking the home or residence (when living independently): does the home remain cool, is the sun protection applied correctly, and is there sufficient ventilation? •

Formal: home care. • Informal: welfare organization, neighborhood network, volunteer networks

Discuss the available options with these partners in the run-up to the local heat plan.

Diverse range of support services

If necessary, organize assistance with operating sun blinds and ventilation of the home. Other examples include greening and maintaining the garden (in collaboration with spatial planning/field services/housing associations) and assistance with grocery shopping.

Cool reception locations

During prolonged heat, it may be necessary for vulnerable people to seek a cool location, either temporarily or for an extended period, because the temperature in their homes has become too high. As part of the local heat plan, cool shelters can be set up. This can be done, for example, by making arrangements with community or village centers, churches, libraries, or other suitable locations. [More information](#)

Municipal partners

5.2 YOUNG CHILDREN AND THEIR PARENTS

Communication

Distribute flyers and posters

Here are general flyers for parents of (young) children, but also specific ones for schools. For additional information, contact [the GGD Leefomgeving](#). to consult .

[Look here for suitable flyers](#)

Information on social media

Information about the local heat plan can be shared via the network partners . This communication channel can be initiated by the municipality and further promoted by the relevant parties. Flyers can be used as a basis for postal mailings in this process.

Disseminate information via partner newsletters and websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Theme meeting for daycare or school

Through Healthy Childcare, a great deal of attention is [also paid to the sun](#) and heat under the theme [of Sun Protection](#) . They can use this in childcare to protect young children from the heat:

[Sun protection from Healthy Childcare](#)

Thematic meeting for childcare staff

The Healthy Childcare coach can organize a meeting for colleagues to focus on the theme of sun protection and heat. Use the Healthy Childcare website for this. On the [Sun Daily Routine Card page](#) There is a lot of information that can be [used during the meeting](#). In addition to this, the information from [GGD Gelderland-Zuid](#) can be used. be used for tips regarding heat at [school and childcare](#).

Theme meeting for parents

By organizing a meeting for parents about this, you ensure that the knowledge you share with each other reaches the parents. Use the information for this meeting that you also use internally. This way, everyone works with the same information. Use the links above for this purpose.

Information at the child health clinic

Use this [flyer](#) to [distribute](#) at the consultation center during the summer months and print it in poster size for the reception area. [View the example here](#).

GGD guidance on heat at childcare centers

In early 2026, the GGD Utrecht region will [have the guidance on heat at childcare centers](#). published. This guidance helps reception facilities prepare for situations involving (extreme) heat, regarding measures in and around the building as well as the development and implementation of the heat protocol.

Advanced planning:

[Neighborhood-oriented approach](#)

5.3 PEOPLE WITH A CHRONIC ILLNESS

Communication

There is an [infographic](#) from the [RIVM](#) available with information about medication:

Information on social media

Information about the local heat plan can be shared via the network partners. This communication channel can be initiated by the municipality and further promoted by the relevant parties. Flyers can be used as a basis for postal mailings in this process.

Disseminate information via newsletters and partner websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Theme meeting

The municipality can organize information sessions on the topic of heat for the chronically ill in collaboration with partners such as the GGD, the Red Cross, and potentially home care organizations and general practitioners/pharmacists. This meeting focuses on conveying information about heat and what to do in case of overheating. Additionally, there is an opportunity to connect people with each other for assistance tasks. [An example presentation can be found here.](#)

Support

Extra home visits

Huisart's search plan

Nivel has a [guide](#) about how general practitioners can deal with heat and vulnerable patients. Information on medication use is also available.

Heat consultation hour

The GGD may consider a [heat consultation hour](#) to organize.

Municipal partners

- General Practitioners / Practice Nurses
- Hospitals
- District nursing
- Home care
- Pharmacies
- Patient organizations

Back to all
target groups

5.4 HOMELESS PEOPLE

Communication

Help guide for professionals

Homeless people are particularly vulnerable to health problems caused by heat. They often lack access to a cool place and are frequently dependent on welfare organizations. Therefore, professionals working with the homeless play an important role in providing support and care during hot periods.

In this [help guide from GGD Amsterdam](#) contains information about health risks and what to do during a heatwave. The content of this guide may be used for your own version.

Communication via apps for the homeless

In Amsterdam, work is done using an [app](#), [Street life](#).

Education

Thematic meeting / training for professionals

To inform professionals working with the homeless about the risks of heat for this target group, and how adequate help and support can be provided, the municipality can organize a thematic meeting in collaboration with the local Public Health Service (Departments of Special Care Reporting Point and Environment & Health). During this meeting, the following topics will be covered:

- Cause: climate change
- Future scenarios
- General health risks
- Risks associated with alcohol, drug, and medication use
- Tips and advice during hot periods: cool keep shelters and bodies cool for vulnerable target group
- Additional points to consider: UV protection, opening hours of shelters, options for storing belongings, pets, ticks.

Support

Distributing water and sunscreen at day care

Childcare facilities can distribute (extra) water at day care centers in collaboration with the municipality, and additionally draw attention to skin protection by distributing sunscreen.

Municipal partners

- RIBW
- Shelter organizations
- Special Care
- Addiction care
- Police
- Drop-in centers
- Parties collaborating on the winter cold scheme

Advanced planning:

Protocol for summer shelter for the homeless

Back to all target groups

5.5 PEOPLE WITH MENTAL DISORDERS

Communication

Distribute flyers and posters For the target audience

[Flyers for people with a mental vulnerability](#). Also available in English and Arabic.

For practitioners

A [poster](#) is also for practitioners. and [practical guide](#) Developed with [information](#) on how to prepare clients for hot periods and how to act during heat.

Information on social media

To provide mentally vulnerable people with information specifically tailored to their situation, local organizations involved in the local heat plan can refer to the following pages via posts on their social media channels: • [GGDleefomgeving.nl: general info](#),

• [GGDleefomgeving.nl: tips for the home](#), • [Hittepsyche.nl - poster](#)

Disseminate information via newsletters and partner websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Thematic meeting/training for professionals

To inform professionals working with mentally vulnerable people about the risks of heat for this target group, and how adequate help and support can be provided, the municipality can organize a thematic meeting in collaboration with the local Public Health Service (Special Care Reporting Point and Environment & Health departments), and possibly an expert from mental healthcare.

During this meeting, the following topics will be covered:

- Cause: climate change
- Future scenarios
- General health risks
- Risk factors for mentally vulnerable people
- Recognizing signals
- What you can do as a practitioner: preparation and advice during a heatwave

Support

Creating a plan with the client, system, and practitioners

- Ensure that the client and their family have the contact details of the treating physicians so that they can get in touch in case of doubt, questions, or deterioration. • Prepare the client for additional monitoring and possible adjustments if antipsychotics, SSRIs, anticholinergics, and lithium are prescribed.

Contact the pharmacist for specific advice regarding this.

- Advise storing the medication in a cool place to maintain efficacy.

Additional monitoring of the condition and signs of heat stress

Recommended for clients:

- With psychosis, depression, cognitive disabilities and a history of violence or suicide attempts.
- Who use psychotropic drugs.
Lithium: in hot weather and heavy sweating, extra attention is needed to ensure adequate salt and fluid intake. One must also be alert for signs of intoxication.

Extra home visits during the hot period

For inspection of home or residence: does the home remain cool, is the sun protection applied correctly, and is there sufficient ventilation?

Municipal partners

- Mental healthcare institutions • Residential institutions
- General Practitioners / Practice Nurses
- Special Reporting Center Care (Outreach care)

Back to all
target groups

5.6 FIELD WORKERS AND LABOR MIGRANTS

Communication

Distribute flyers and posters in multiple languages
The Red Cross has produced special leaflets in multiple languages about what to do during a heatwave that municipalities and professionals in healthcare and welfare can use. These leaflets are regularly revised.

[The brochures can be downloaded here for free.](#)

Information on social media (multiple languages)
There are no standard posts or videos available in multiple languages (yet) that can be shared on social media. This can be developed based on the Red Cross flyers.

Information for employers
For general occupational health and safety information, the central government has a [page with tips and tools for employers](#). The [municipality can share](#) this information with companies at increased risk of health problems during heat. The Social Economic Council (SER) also has a [page with information](#) for working in (extreme) heat.

Disseminate information via newsletters and partner websites
Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Theme meeting
The municipality can organize information sessions on the topic of heat for both employers and employees in collaboration with partners such as the GGD, the Red Cross, and potentially occupational health services and employment agencies for migrant workers .

Support

Finding protocol
Organizations can draw up a heat protocol for their employees themselves. This includes agreements regarding weather conditions, a tropical schedule, drinking breaks, sunscreen, and shade.
See this [example of a construction company](#) for inspiration.
[Heijmans](#)

Municipality search protocol
The municipality can also draw up a heat protocol for its own employees. Think of enforcement officers and garbage collectors. This can be developed in collaboration with HR.

FNV work climate app
[This app](#) has been developed to provide support during hot weather.

EXTRA INFO Many workers in the Netherlands face (extremely) hot conditions in the workplace. Examples include road workers, landscapers, construction workers, roofers, and employees in greenhouse horticulture. But also bakers, workers in the steel and glass industries, and firefighters. The Working Conditions Act (Arbowet) obligates employers to ensure a safe and healthy workplace, even during heat.

Municipal partners

- Employers
- Supervision and enforcement
- Municipal housing

 **Back to all target groups**

EXTRA INFO

Providing information to people with intellectual disabilities requires a specific approach. It is important to offer the information clearly, concretely, and tailored to their needs. Organizations such as KansPlus, LFB and Sien

advocate for the interests of people with intellectual

disabilities and their loved ones, and can offer support in doing so.

Municipal partners

- Agencies guided living
- Sheltered living
- Care farms
- Day activities

← Back to all target groups

5.7 PEOPLE WITH INTELLECTUAL DISABILITIES

Communication

Tips and advice visualized and tailored to the target audience

There is currently no communication material available specifically aimed at people with intellectual disabilities. To further develop this in collaboration with local, regional, or national partners, use can be made of existing communication material from the RIVM in which the message is visualized as much as possible . the Red Cross or the Municipal Health Service (Example Infographic North and East Gelderland).

Education

Thematic meeting/training for professionals

To inform professionals working with people with intellectual disabilities about the risks of heat for this target group, and how adequate help and support can be provided, the municipality can organize a thematic meeting in collaboration with the local Public Health Service (GGD) and possibly an expert from disability care. During this meeting, the following topics will be covered:

- Cause: climate change
- Future scenarios
- General health risks
- Risk factors for people with intellectual disabilities
- Recognizing signals
- What can you do as a therapist/counselor: preparation, and advice during a heatwave

Support

Extra home visits

For inspection of the home or residence (in the case of independent living): does the home remain cool, is the sun protection applied correctly, and is it sufficiently ventilated?

Help with sun protection & ventilation

If necessary, arrange for the sun blinds to be lowered in time and the home to be well ventilated when the outside temperature has cooled down.

Help with greening the garden

When living independently, organize help with greening and maintaining the garden.

Help with groceries

If necessary, organize help with grocery shopping to relieve the burden on the people.

Advanced planning:

Personal heat plan

5.8 REFUGEES

Communication

Distribute flyers and posters in multiple languages

The Red Cross has produced special leaflets in multiple languages about what to do during a heatwave that municipalities and professionals in healthcare and welfare can use. These leaflets are regularly revised.

[The brochures can be downloaded here for free](#)

Disseminate information via newsletters and partner websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Thematic meeting in multiple languages

Public Health for Asylum Seekers can organize a meeting to focus on heat. Information can be provided during this meeting regarding:

- Drink enough
- Information about swimming risks
- Find icm de Ramadan
- General health tips for heat

Municipal partners

- Refugee Aid
- COA

Back to all
target groups

5.9 PREGNANT WOMEN

Communication

Distribute flyers and posters

The same communication materials can be used for pregnant women as for all residents. Therefore, existing flyers and posters from the RIVM, the Red Cross, or the GGDs can also be distributed to midwives and general practitioners to reach this target group. On the GGD Noord- en Oost-Gelderland website, the general infographic also includes a section for pregnant women: [Local heat plan | GGD Noord- en Oost-Gelderland](#)

Information on social media

For basic information, you can use the channels of midwives or other suitable partners are referred to [GGDleefomgeving.nl](#). There are also [various websites such as oudersvannu.nl](#) and [24baby.nl](#) collect those tips and [advice for pregnant women to which](#) reference can be made.

Disseminate information via newsletters and partner websites

Ensure that communication via the channels frequently visited by the target group is considered during the preliminary phase. This can be done through all collaboration partners. By preparing this in advance, it can be communicated immediately upon activation of the heat plan. When providing information, consider measures individuals can take themselves, as well as the impact of medication during heatwaves.

Education

Theme meeting

To provide pregnant women with information about the risks of heat and how to deal with them during pregnancy, the municipality can organize an information session in collaboration with midwifery practices and the local Public Health Service (GGD). During this session, direct attention can also be paid to the risks of Heat for babies and young children, and how (future) parents can take precautions and know how to act in hot weather.

One-on-one advice

Midwives and general practitioners can provide one-on-one information prior to the summer period and/or during a hot period. Practices can create their own heat protocol for this.

Did you know?

Research shows that heat during pregnancy can cause premature birth and low birth weight. Especially among people with a lower socioeconomic position.

Municipal partners

- Midwifery practices
- Gynecologists
- Child and Youth Health Care professionals
- General Practitioners

6. SELF-ASSESSMENT

6.1

Purpose of self-assessment

6.2 Assessment Matrix

6.3 Explanation of assessment criteria

6.1 PURPOSE OF SELF-ASSESSMENT

Local heat plans establish at the municipal level how health risks associated with heat can be prevented. They describe objectives and agreements regarding preventive information, communication, and support, specifically aimed at vulnerable residents. The exact details of how this is implemented may vary. An effective local heat plan requires a tailored approach, as every municipality is different.

This self-assessment, intended for internal use, can serve as a guideline and inspiration. It provides an overview of the essential components and inspiration to further strengthen and improve the plan step by step. In this way, the heat plan can continue to develop into an approach that effectively protects all vulnerable residents and, moreover, aligns with the local situation and ambitions.

	Policy	Target groups	Cooperation	Education	Monitoring & Evaluation
Basis ↓	The local heat plan has been completed and announced.	Measures specifically aimed at, at least, the target group of elderly people living (semi-)independently at home	Collaboration between the municipality, the Public Health Service (GGD), and (elderly) care and welfare organizations. One core team coordinates.	Information about heat and health is sent to partners and target group distributed	Process evaluation with local partners after the summer period
👍	The local heat plan is linked to and embedded in policy in the social and spatial domains.	Measures aimed at 3 different target groups are described.	Collaboration and structured consultation with local partners relevant to the actions aimed at 3 intended target groups	Communication and information activities aimed at and tailored to the 3 target groups	Process evaluation via a live meeting
👍👍	The local heat plan is part of target group-specific policy.	Measures aimed at 5 different target groups are described.	Collaboration and structured consultation with a broader circle relevant to the actions aimed at 5 intended target groups	Communication and information activities aimed at and tailored to the 5 target groups	Process evaluation via a live meeting and monitoring actions
👍👍👍	Local heat plan is part of Integrated Heat Action Plan	Measures aimed at all possible target groups are described	A formal heat network where the heat approach is implemented through co-creation and shared ownership.	A complete communication and information campaign	Heat perception and effectiveness of the actions is continuously and systematically monitored

The basic level

The basis of every local heat plan is the local elaboration of the national heat plan, aimed at the practical implementation of the warning system as well as preventive activities. The local heat plan contains working agreements between local partners, the municipality, and the Public Health Service (GGD) regarding how to act in preparation for and during hot periods. A local heat plan includes at least: concrete cooperation between (primary) care partners and the municipality, an annual evaluation after the summer period, the dissemination of public information to increase knowledge and awareness regarding heat, and focuses on at least one target group, such as elderly people living at home (semi-)independently.

Policy

 The theme of heat and the actions stemming from the local heat plan are anchored in municipal health, adaptation, and environmental policy. **For** example, in the Health Memorandum, Housing and Care Vision, Climate Adaptation Strategy, Environmental Vision, or Environmental Programme. The involved partners have also incorporated heat into their policies.

 **In** addition to anchoring in general policy, the theme of heat and the actions are Also anchored from the local heat plan in target group-specific policies such as elderly policy, the approach to homelessness, playground policy, and housing for migrant workers.

 **There** is an Integrated Heat Action Plan, which includes the local heat plan and the actions from the health domain are connected to the building and the area.

Target groups

 The plan describes measures for three target groups, for example , the elderly, the chronically ill, and young children. The approach for these groups is concrete, locally appropriate, and coordinated with relevant partners.

 The plan describes measures for five target groups, such as the elderly, the chronically ill, young children, the mentally vulnerable, and people with intellectual disabilities. The approach for these groups is concrete, locally appropriate, and coordinated with relevant partners.

 The plan covers all relevant target groups in the municipality. All groups have been assigned specific measures or points of attention, ensuring the plan is broadly applicable and that no one is forgotten .

Collaborations

 The core team holds structured consultations and has made clear agreements regarding roles and responsibilities. Connections have already been established with social organizations that directly touch upon 3 target groups (such as housing associations, home care, and community centers) . Collaboration focuses on anchoring and working agreements.

 The collaboration is being actively expanded to a broader circle of social partners, such as schools, sports clubs, churches, housing developers, and event organizers. **More and** more connections are being established, with at least five different types of partners, causing the network to grow and ensuring that various domains know what to do during heatwaves.

Partners and the municipality join forces for heat initiatives.

 : An official heat network organized and facilitated by municipal partners, where the heat approach is implemented through co-creation and shared ownership. This network is the place where all heat initiatives come together and are structurally secured. Residents and organizations are actively involved, ensuring that the heat plan is widely supported and embedded locally.

Communication & Information

👍 : The communication material and the information activities are aimed tailored to the 3 target groups you want to reach.

👍👍👍 : The communication material and the information activities are specifically tailored to the 5 target groups you want to reach.

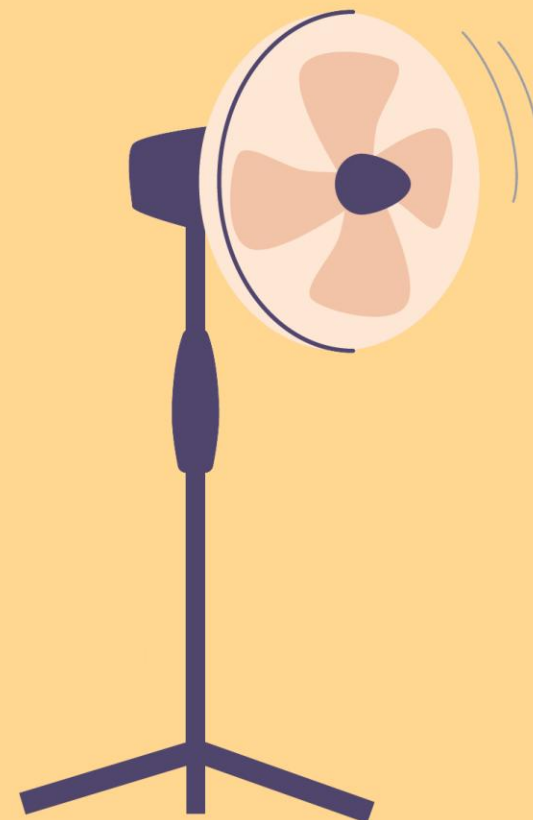

👍👍👍👍 : A complete communication and information campaign with Targeted activities developed and aligned with both partners and target groups. The campaign is a coordinated series of actions executed from the preparation phase through the warning phase, and organized via various channels. This creates continuity and broad support for awareness of heat and the associated measures during hot periods.

Monitoring and evaluation

👍 There is a broader annual process evaluation of the summer period, including the communication and information approach, during a live meeting with all partners. Lessons learned from the summer period will be incorporated to improve implementation and, if necessary, adjust the heat plan .

👍👍 There is a broader annual process evaluation of the summer period, including the communication and information approach and actions aimed at direct support for vulnerable people, during a live meeting with all partners.

👍👍👍 : There is structural monitoring of heat stress and the effectiveness of all measures from the heat plan. Results are used to continuously adjust and optimize the plan for maximum health and safety.

SOCIAL MEDIA POSTS

Sample texts for

Facebook on

Instagram:

It is important to be careful from 25 degrees!

There are several tips:

- Stay out of the sun between 12 and 3 pm
- Drink enough water, about a glass of water per hour
- Keep yourself and your house cool
- Avoid strenuous activity and be careful when playing sports
- Pay attention to the elderly and the sick

Read more about these tips on [Health complaints due to heat](#)

#GGDLeefomgeving #heat #overheating

Maximum temperatures will rise starting Sunday. It will be very hot in almost the entire country, especially on Monday. It is important to be careful then.

- Wear thin clothing and a hat or cap.
- Stay in the shade and avoid activities that involve a lot of movement in the afternoon.
- Take a lukewarm shower once during the day.
- Or sit with your feet in a basin or bowl of water.
- Pay extra attention to the vulnerable people around you.

<https://ggdleefomgeving.nl/zomer-en-hitte/>

How do I recognize health problems caused by heat?

Pay extra attention to the following symptoms in the elderly, young children, the sick, or other vulnerable people:

- Overheating (fatigue, headache, dizziness)
- Heat exhaustion (fainting, cramps, heavy sweating)
- Heatstroke (high body temperature, nausea, convulsions)

If you experience symptoms of heatstroke, it is important to call 112 immediately.

Want to know what to do for which symptoms, and what you can do to prevent symptoms? Check <https://ggdleefomgeving.nl/zomer-en-hitte/gezondheidsklachten-door-hitte/#oververheating>

Tips for the heat

Drink plenty of fluids, even if you are not thirsty. Drink water in particular.

Wear light clothing, a cap or hat, and take it easy. Be sure to do at

No activities involving a lot of movement in the afternoon.

Keep your house cool. Use awnings or roller shutters, close the curtains, and keep windows and doors closed during the day. Start doing this immediately when it gets hot!

Cool your home at night by opening windows opposite each other (ventilating).

You can read more about summer & heat at <https://ggdleefomgeving.nl/zomer-en-hitte/>

II. NEIGHBORHOOD-ORIENTED APPROACH

Whereas the National Heat Plan is translated into local policy in a local heat plan, the Neighborhood Heat Plan goes a step further: towards the capillaries of the neighborhood, close to the people at risk during extreme heat.

The approach

A Neighborhood Heat Plan is drawn up together with residents, neighborhood organizations, and partners—and therefore **together** with the neighborhood. An approach based on equality is chosen for this, resulting in ownership and a high-quality plan.

How do residents experience and use heat mitigation measures, such as a cool spot or shade cloths, in their surroundings? How do municipalities measure and utilize knowledge within and from the neighborhood? Which innovations are appropriate for a particular type of neighborhood, and how can stakeholders in the neighborhood prepare for a situation of severe heat? Who assumes which responsibility or role, and how do we strengthen and/or facilitate self-care and mutual care? The answers to these questions are captured in the Neighborhood Heat Plan. What works in one neighborhood does not necessarily work in another. Therefore, the Municipality of Rotterdam developed a tailored approach for each neighborhood – together with residents, neighborhood organizations, and key figures.

Guidance document for the Rotterdam neighborhood heat plan

III. PERSONAL HEAT PLAN

As advanced planning based on a local heat plan, an additional step is to create an anticipatory, personal heat plan every spring for high-risk groups. This applies to people with dementia, Parkinson's, MS, or kidney loss, among others.

Tailored to personal situation

In a personal heat plan, healthcare professionals can make tailored agreements regarding informal care, measures from the national heat plan, and monitoring indoor temperature, fluid intake, cooling vests, and medication adjustments. Daily weighing helps detect dehydration in a timely manner. Relatives can also recognize whether early symptoms of heat stress are occurring, such as fatigue, loss of concentration, headache, dizziness, muscle pain, thirst, disturbed sleep, or excessive sweating. Moreover, some neighborhoods are more sensitive to heat than others, which can result in a difference of several degrees. Knowing this is important for the individual, the municipality, and the Public Health Service (GGD).

New development

There are still few examples of personal heat plans.

Primary care organization sterkz.org from Utrecht started developing personal heat plans in 2022. Their manual can serve as inspiration for healthcare institutions to get started with this personalized approach for high-risk groups themselves.

[Personal heat plan manual sterkz.org](https://sterkz.org)

IV. PROTOCOL FOR SUMMER SHELTER FOR THE HOMELESS

A protocol for summer shelter for the homeless describes how municipalities and organizations provide shelter and support to people without a fixed place of residence during the summer period. This protocol is particularly important when temperatures rise and extra measures are needed to protect the homeless from the heat.

Key elements of the protocol

- Early detection: The protocol describes how organizations can detect and identify homeless people.
- Provision of shelter and cooling: Suggestions to include in the protocol: additional shelter options (extra locations or extended opening hours), additional cooling options (water points, shaded areas).
- Information and education: The protocol describes the information cycle regarding available shelter and cooling options, for example via leaflets, posters, or verbal communication.
- Collaboration: Include collaboration between various parties, such as municipalities, social care organizations, the Public Health Service (GGD), and welfare institutions, in the protocol.

Example Municipality of Amsterdam

V. HEAT ACTION DAY

Heat Action Day is an international day that draws attention to the risks of extreme heat resulting from climate change. The day has been held annually on June 2 since 2022 and is an initiative of the International Red Cross. Heat Action Day mobilizes cities, residents, and organizations worldwide to take action and demonstrates that even simple measures can make a big difference in preventing heat-related health problems. Each year has its own theme.

Heat Action Day in Nederland

On June 2, 2025, the Netherlands participated for the first time. Throughout the country, people shared their heat mitigation measures to raise awareness about the risks of heat. Rotterdam formed the beating heart of the heat day that day, where the knowledge day 'Sweating is Knowing' was organized. Policymakers, scientists, students, and neighborhood professionals gathered here to share experiences. Buildings in the city also lit up orange, and runners could participate in a HitteRun along shady spots.

Distribute fans and take heat measures

Heat Action Day is a good time to take concrete action. One example is to set up an action together with a social organization. During this action, fans can be distributed to the elderly and people with low incomes. Social organizations

have a good overview of which people in their neighborhood live in homes that are too hot. Mosquito nets and sunshades could also be considered. While handing out, you can have a heat conversation with residents.

VI. SKIN CANCER PREVENTION

Exposure to UV radiation is the most important risk factor for skin cancer. The Dutch Cancer Atlas shows that skin cancer in the Netherlands is still increasing, and that UV exposure is a major risk factor, which underscores the importance of preventive measures.

Exposure to UV radiation primarily occurs in public spaces; therefore, a municipality can contribute to prevention and awareness with relatively simple measures. Measures that protect against the sun fall into 3 categories: 1. Blocking the sun by creating shade.

- 2. **Protecting yourself** from the sun by wearing UV-protective clothing.
- 3. **Applying** sufficient sunscreen.

There are various ways to limit UV exposure. Always start with avoidance: provide shade in places where people spend extended periods, for example by planting trees or installing shade cloths and canopies. If avoidance is not possible, encourage the wearing of protective clothing and a cap or hat. Only when these measures are insufficient should applying sunscreen come into play: consider sunscreen dispensers at playgrounds, sports fields, and beaches. Additionally, UV index signs in busy locations can help make residents aware of the current risk.

An approach becomes effective by focusing on awareness and communication in addition to physical measures. Inform residents about safe sunbathing and the UV index, and pay extra attention to vulnerable groups such as children, outdoor workers, and athletes. Collaborate with schools, childcare facilities, sports clubs, and other partners, and align with national campaigns or local health projects to increase your impact.

Want to know more about the health effects of UV radiation and measures to protect against the sun? Visit the websites of the **Huidfonds**, the **RIVM**, and the **GGD**.

VII. (SPORTS) EVENTS

Visitors to events may face a health risk in hot weather.

Heat can lead to symptoms such as headaches, muscle cramps, dizziness, and, in severe cases, loss of consciousness or worse. Anyone can experience these symptoms, but young children, the elderly, and the chronically ill are at the greatest health risk. During sporting events, participants run the risk of overheating and heatstroke due to the exertion.

This is even more true when there is a lot of moisture in the air. This is called high humidity.

Events in warm weather

Are you organizing a sports day, sports activity, or another event on a hot day? Then use the heat index and this table. to assess the level of risk. Various factors play a role here, such as wind speed at the event location, the amount of shade, but also whether vulnerable groups are present or participating and the intensity of the exertion. The organizers can take various measures, such as providing access to drinking water and cool spots or fans. And if necessary, the event can be postponed or even cancelled.

Hospitalizations and deaths

Unfortunately, in recent years, it has happened that participants in a sporting event have been admitted to the hospital or have even passed away. During the Loop van Leeuwarden in 2025, a participant died and several others became unwell due to the heat. In the same year, a participant also died of heatstroke during the Marathon Enschede. During the Nijmegen Four Days Marches in 2006, two men died from the heat, leading to the cancellation of the remainder of the march—the first time in history. Both deceased participants were well-prepared and healthy, but succumbed to the extreme temperatures of around 32–33 degrees Celsius, resulting in hundreds of runners becoming unwell. The organization has drastically tightened safety measures since then.

VIII. COOL RECEPTION LOCATIONS

According to the Climate Adaptation Dictionary is a cool indoor space a living location in a building that remains between 19–25 °C during heat.

Such spaces are intended for multiple people and sometimes even longer stays. Typical examples are libraries, supermarkets, churches, museums, and theaters.

However, not all of these locations are suitable for accommodating residents during prolonged heat. In addition to guaranteeing a cool temperature, the locations must be designed to offer a group of people a pleasant place to stay. This means that the location must be open during the summer period, that staff are present to welcome residents, that admission is free, and that additional activities may be offered .

Cool shelters in The Hague

In The Hague's neighborhoods, special cooling spots are being set up where people can cool down and take shelter from the heat. This could be a company with an air-conditioned canteen, a library, but also churches or mosques. Agreements regarding this have been made for a number of locations, including the libraries, as part of the local heat plan.

Swimming pools as cooling spots

An outdoor swimming pool can also be a cool place. Families and people with homes that are too hot, in particular, can find relief from the heat in and around the pool. The municipality can make agreements regarding the opening hours of the pool. The municipality can also choose to make access free for people with a city pass. In this way, the municipality removes the barrier to cooling off. However, the layout of the pool must be considered to ensure sufficient shade and drinking water points.

IX. HITTEKRACHT AND HITTEKFIT

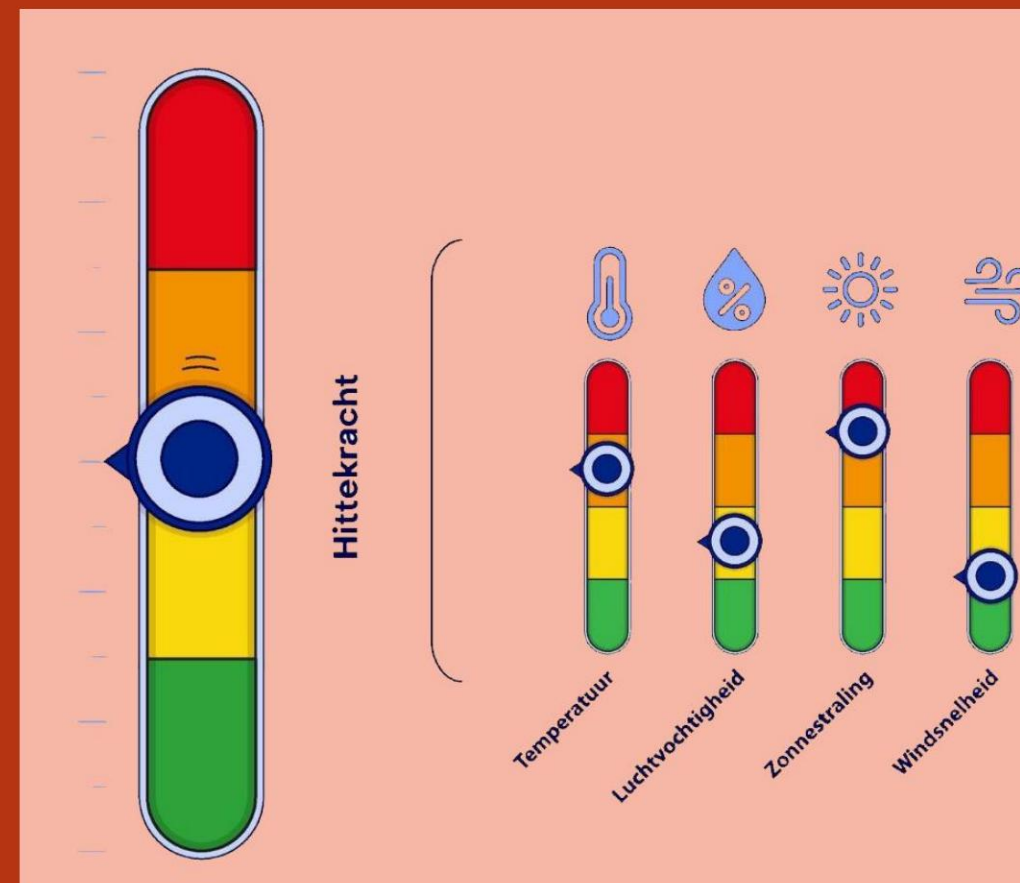

Faith Power

Heat load index is an index used to express exposure to heat. It combines multiple factors into a single number. In addition to temperature, heat load index also takes into account humidity, radiant heat, and wind. By combining all these factors, a better risk assessment can be made on hot days than with temperature alone. This ensures that people can better prepare for a certain heat load.

Heat fit

How well someone can tolerate a certain heat intensity depends on various contextual factors. Therefore, in addition to the influence of ambient heat (heat intensity), the model also distinguishes the influence of how 'heat-fit' one is. In other words: how well someone can adapt to the heat. This adaptability depends on four factors: activity level, freedom of clothing choice, environmental adaptability, and personal factors such as health and fitness.

X. TASKS AND DIVISION OF TASK PER PHASE

	Phase	Period	Start and end	Definition	Activities	Comments
	Prevention and knowledge development in the social and healthcare sector, raising awareness, providing a course of action, influencing behavior	Preparation mainly takes place outside the heat season, with an emphasis on Oct-May; the implementation of prevention actions takes place between March - september	Cyclical/year-round. Partly based on monitoring and evaluations of recent heatwaves.	Raising awareness among professionals, residents, and vulnerable target groups about the risks, providing information, offering courses of action, and providing help and support.	Expanding and improving knowledge/information, measures, and instruments. Increasing awareness and ownership among both professionals and residents. Capacity building among implementers and target groups.	The prevention phase is interwoven into all other phases
	Preparation phase	March 1 – June 1		Every spring, the information and tools available at that time must be made available, as well as the responsible organizations and/or persons.	Local (informal) partners and involved professionals coordinate measures. They share knowledge and prepare protocols and plans for (instructions on) limiting heat stress and health damage caused by heat.	Is also referred to as the 'vigilance phase' in some regions
	Pre-warning/information phase	Possible between June 1 – Sept 30	Start with advance warning/information directed by the RIVM, 1 – 2 days before the warning phase	If there is a high probability of a period of four or more days with a temperature above 27°C	The parties involved ensure that all participants are aware of upcoming tasks. The parties check whether all necessary resources are ready.	
	Warning phase	Possibly between June 1 – Sept 30. May need to be expanded in the future.	Starts with heatwave announcement by RIVM. Ends with RIVM heatwave email/announcement. GGDs forward this email to chain and care partners in their area	A 90% or greater chance of a prolonged period of warm weather, four consecutive days with a temperature above 27°C	Analogous to the National Heat Plan, the local heat plan is activated during this period. Agreements made before or during the preparation phase are being implemented. Involved parties carry out their tasks, with direct contact with the target groups being paramount.	In some regions, it is also referred to as the 'acute phase'. This phase includes emergencies. In some regions, separate attention is paid within this to temperatures above 32°C.
	Evaluation	Emphasis on Sept – Nov		During the annual evaluation, it is assessed whether the guidance and protocols remain sufficiently up-to-date with a view to optimally reaching and informing the target groups. New stakeholders may be added. New scientific insights may be incorporated. Furthermore, practical matters, such as links or references, may be adjusted.		When heat plans are expanded to include the prevention phase or other themes or domains, evaluation/monitoring is also expanded.

A. TASKS IN THE PREPARATION PHASE

These tasks serve as examples for inspiration, and of be allowed deviated

Organization	Taken	Who in the organization?	Target group	Explanation
Municipal partners	Updating local heat plan – joint task	Contact persons partners, municipality (designated coordinator) with the Environment Team and Health or GGD Health Promotion team	Care chain, Civil society organizations, General public, Social networks.	Establish in an agreement which persons from the municipal partners perform this task at the beginning of the annual cycle.
Local authority	Mapping the urban areas where vulnerable target groups to be located	Policy officers social domain – social neighbourhood teams	General public Own organization	Improve assurance. Include in regular duties. Determine who has ultimate responsibility.
	Publish information about heat and health on the municipal website	Policy Officer Social Domain	General public Own organization	Improve assurance. Include in regular duties. Determine who has ultimate responsibility.
	Consult with the communications department regarding (adjusting) the communication strategy	Designated heat plan coordinator	Own organization	Improve assurance. Include in regular duties. Determine who has ultimate responsibility. Coordinate with the communications department.
GGD and other municipal partners	Inform residents	Coordinators of heat actions involved organizations. Environment and Health Team and Public Health Service Health Promotion	General	Raising awareness about heat on GGDLeefomgeving.nl during the summer period.
	Update own resources		General	Updating and developing proprietary materials, including the texts for heat warnings and communication messages
	Inform employees		General	Informing own employees so they know what to do when heat alerts are sent out
	Inform the municipality and organizations		General	Making the heat fact sheets available and sharing them annually with the municipality and social partners. This communication material is general, but also specifically targeted at the elderly, children, and athletes.
	Inform organizations		General	Calling upon various stakeholders in the region to sign up for the heat mailing. With this heat mailing, the GGD shares the content of the heat plan and examples of communication materials during the preparation phase.
	Supporting the municipality		General	Supporting the municipality in updating the local heat plan
	Informing parents and caregivers of young children	Coordinators of heat actions involved organizations. Environment and Health Team, health promotion and youth health care GGD	Provide information about heat to parents/guardians of children under two years of age via the CJG.	Children

B. TASKS IN THE WARNING / INFORMATION PHASE

These tasks serve as examples for inspiration, and it is allowed deviations may occur.

Organization	Taken	Who in the organization?	Target group	Explanation
Local authority	Prepare news item and press release	Communication consultants	General public	Review news item and press release preliminary information/verification from the communications department and prepare for possible publication in the weekly magazine and on social media.
	Distribute leaflets	Social Policy Officer Development	Municipalities General public	Distributing leaflets to local partners and own locations
GGD	Inform residents	Environment and Health Team and/ or health promotion	General	Send news and press releases to the communications department to inform the residents of the region
	Inform the municipality	Environment and Health Team and/ or health promotion	General	Forward advance warning to (the core team of) the municipalities with a local heat plan (The municipality may choose to forward this message to affiliated organizations.)
	Inform GHOR event team	Environment and Health Team and/ or health promotion	General	Forward advance warning to the GHOR event team HM
	Inform own staff	Environment and Health Team and/ or health promotion	General	Inform involved departments (Reception, Intensive Care Unit, Youth Health Care, Inspectorate) Childcare centers, GL, FGK) from the GGD on vigilance
Organizations in care, welfare, and housing	Inform residents	Coordinators of heat actions involved organizations	Vulnerable target groups	Send news messages to the communications department to inform the residents of the municipalities

C. TASKS DURING THE WARNING PHASE

These tasks serve as examples where deviations are required. for inspiration, and may

Organization	Taken	Who in the organization?	Target group	Explanation
Local authority	Post news item and send press release	Communication consultants	General public	Post news item and press release by communications department weekly magazines make use of social media
	Communication campaigns	Policy Officer in the Social Domain	General public	Communication via social media, website
GGD	Forwarding RIVM heat warning to organizations in the region	Environment and Health Team and/or Health promotion	General public	Forwarding the RIVM heat warning to the contacts on the mailing list and providing them with information material.
	Forwarding RIVM heat warning to the GHOR Environment and Health Team and/or	Health promotion	General public	Forwarding the RIVM heat warning to the GHOR events team.
	Communication campaigns	Environment and Health Team and/or Health promotion	General public	Providing public information, posting news items, and sending press releases by the communications department
Organizations in care, welfare, and housing	Warn residents	Coordinators of heat actions involved organizations	Vulnerable target groups	Send warning messages to the communications department to inform the residents of the municipality

D. MONITORING AND EVALUATION

These tasks serve as examples for inspiration, and of be allowed deviated

Type of organization	How?	Action	Explanation	Target group
All municipal partners	Allen	Evaluate local heat plan	Municipal organizations join the evaluation meeting organized by the municipality and update their own (communication) materials where desired.	General
Local authority	Communications, Local Heat Plan Coordinator	Heat communication strategy	The municipality is consulting with the communications department regarding (adjusting) the heat communication strategy.	General
	Local search plan coordinator	Schedule evaluation of local heat plan	The municipality is organizing a meeting with all involved partner organizations to evaluate and refine the local heat plan. If desired, organizations that were not present at previous meetings will also be invited.	General
	Field Service	Evaluate heat protocol	Field service evaluates its own heat protocol	Own employees
GGD	Environment and Health Team	Monitoring developments	Monitoring national developments regarding (the prevention of) heat stress	General
Red Cross	Red Cross	Internal evaluation	Evaluating their own actions from the past year. In addition, volunteers evaluate the process after each workshop.	General

E. PREVENTION, KNOWLEDGE DEVELOPMENT AND BEHAVIORAL INFLUENCE

These tasks serve as examples where deviations are required. for inspiration, and may

Type of organization	How?	Action	Explanation	Target group
Local authority	Physical domain	Mapping cool indoor locations	Identify which places remain relatively cool during periods of heat and investigate whether these places are suitable for sheltering vulnerable residents. Examples of potential cool places are the library and the shopping center. The target group must be taken into account in this regard.	General
	Physical domain	Taking measures in the physical space	The municipality is considering taking measures in the physical space, such as placing benches in shady spots and installing sun protection poles and water taps in busy areas, to protect residents and raise awareness.	General
	Social domain	To research	Investigate possibilities for financial support for heat mitigation measures in the city. Such as a subsidy for sun shading and cooling.	General
	Physical domain	Greening outdoor space	Develop heat-resistant urban planning and infrastructure, such as green spaces and walking routes.	General
	Field Service	To research	The field service is investigating adjusting working hours and the possible closure of the recycling center during extremely hot periods, and will subsequently add this to its own heat protocol.	General
	Social domain	To research	The municipality is present at the care market in the Winkelhof to gather insights regarding heat.	General
GGD	Environment and Health Team and/or health promotion	Information on heat & health	At the request of municipalities/organizations, the GGD can provide information on heat & health.	General
	Environment and Health Team and/or health promotion	To research	Investigate the possibility of making its own heat warnings and communication messages available in widely used relevant languages.	General
	Environment and Health Team	Research health guidelines	Research and develop national health guidelines for various heat scenarios	General
Red Cross	Red Cross	Developing and sharing information	Developing and sharing informational materials, scientific research, and international experiences of the National Climate Centre.	General

COLOPHON

This guidance document has been prepared on behalf of the Ministry of Health, Welfare and Sport and the RIVM.

Project group

- Saskia van Daalen, Health Broker | GGD Gelderland-Zuid
- Margriet Blijham, Health Promotion Advisor and Healthy School Advisor | GGD Fryslân
