Land Acknowledgement

The City of Los Angeles recognizes that we occupy land originally and still inhabited and cared for by the Kizh, Tongva, Tataviam, and Chumash Peoples. We honor and pay respect to their elders and descendants — past, present, and emerging — as they continue their stewardship of these lands and waters. We acknowledge that settler colonization resulted in land seizure, disease, subjugation, slavery, relocation, broken promises, genocide, multigenerational trauma, disruption of cultural practices, trade, and tribal relations. This acknowledgment demonstrates our responsibility and commitment to truth, healing, and reconciliation and to elevating the stories, culture, and community of the original inhabitants of the City of Los Angeles. We are grateful to have the opportunity to live and work on these ancestral lands. We also honor the self-attestation of current mission-based Tribes confirming their connection to the ancestral lands on which we live and work today:

Gabrieleno San Gabriel Band of Mission Indians
led by the Gabrieleno Tongva Tribal Council

Gabrieleeño Band of Mission Indians - Kizh Nation

Fernandeño Tataviam Band of Mission Indians

Northern Chumash Tribal Council

Letter from the Mayor

Cities are the front lines for the climate crisis. Angelenos are living with the impacts every day—from devastating wildfires and floods to rising heat and longer heat waves. We won't feel those impacts equally, as they will differ across the diverse communities and landscapes that make up our city. Rather, these impacts are felt locally, in our neighborhoods, our homes, our schools, and our workplaces. Our most vulnerable residents, including low-income families, communities of color, and unhoused neighbors, are often hit the hardest.

The impacts are local, and so are many of the solutions needed to address the climate crisis. Los Angeles remains a committed leader to climate action, both to slow down climate change and to prepare for the already seen and felt impacts of a changing climate. Our land use, energy choices, transportation, and buildings drive climate change and, in turn, climate solutions. Our decisions today will impact Angelenos for generations to come, making city action that much more critical. Especially at this moment, local leaders must act to ensure a safe, resilient, and equitable Los Angeles.

Los Angeles has been a climate leader for decades. As home to the largest municipally owned electric utility, along with one of the busiest port complexes and airports in the country, we impact daily life and the economy here in the city, across the region, and beyond. Focused on implementation, I have established a Climate Cabinet with representation from city leadership and key departments to drive the city's climate commitments. We've met critical milestones, including becoming a coal-free city. These investments in reliable energy, local water capture, and green infrastructure, to name a few, also create local jobs for Angelenos, helping us meet our green jobs target early.

This plan builds on years of climate leadership, while centering equity, resilience, and tangible results for Angelenos. A resilient, climate-safe Los Angeles is one where every Angeleno can thrive. We must continue to use our city levers to deliver urgent, equitable climate action that improves daily life in our neighborhoods, protects against future risks, and builds a fair, green economy. These city levers include how we design and operate our buildings, invest in our streets and sidewalks, and build infrastructure that achieves multiple benefits, all while prioritizing those most vulnerable to climate change.

This plan focuses on what we, as a city, can do to build a cleaner, more sustainable future. It's meant for every Angeleno, every city department, and every partner. It's a roadmap for clear actions that Los Angeles will take, why they matter, and how we will track success. Most importantly, this plan outlines how Angelenos will benefit from a resilient, carbon-free LA.

Mayor Karen Bass

Letter from the Deputy Mayor of Energy and Sustainability

Los Angeles has a long history of ambitious climate action, driven by visionary Mayors: we have built a strong foundation rooted in best practices, using the latest science and a commitment to equity. As Deputy Mayor of Energy and Sustainability in 2026, I am already witnessing communities across Los Angeles experience hotter summers, longer dry periods, and more intense storms. Our work is more urgent than ever.

Our Mayor builds on LA's climate action legacy and has taken bold steps to create a healthier, climate-resilient city for every Angeleno. This Implementation Plan shifts from setting ambitious goals to delivering on them. In the summer of 2024, the Mayor established her Climate Cabinet with 14 key departments that drive climate action at the City. We have worked directly with City departments to better understand the climate work already underway, identify viable pathways to achieving our targets, and align efforts across departments to drive coordinated solutions to climate change.

While developing this plan, our team received constant feedback from community members, researchers, and partner organizations across Los Angeles. With the everyday goal of creating a more beautiful and resilient Los Angeles, their expertise helped us identify critical gaps in our approach, including the need to address adaptation to extreme heat, embed nature-based solutions into our core services and infrastructure, and ensure LA's most vulnerable communities benefit from our climate investments.

This plan reflects the Mayor's commitment to partnership and collaboration to ensure our climate work is effective and accountable. Every Angeleno should be able to understand what we are doing and why it matters, and feel the improvements from our efforts.

While we remain on course to reach carbon neutrality by 2045, this plan also reflects the need for transformative climate action that goes beyond reducing our emissions. This plan seeks to address the impacts our city is already experiencing by directing that solutions such as increased shade, resilience centers, and sustainable transportation be designed and distributed equitably.

As we move forward with implementing our climate goals under our Mayor's courageous leadership, we will continue to rely on community leadership and departmental collaboration to transform Los Angeles into a more resilient and equitable place for Angelenos and nature to thrive, no matter the neighborhood they call home.

Deputy Mayor Nancy Sutley

Executive Summary

Building on decades of progress as a global climate leader, the City is setting a clear path to reach carbon neutrality by 2045 while investing in our community resilience. Los Angeles is driving climate action by centering equity and economic growth in this implementation strategy, serving as a global model, and focusing on near-term actions over the next decade to keep us on the path to carbon neutrality. Mayor Bass' vision is for a resilient, climate-safe Los Angeles where every Angeleno can thrive. This vision balances immediate improvements to daily life in Los Angeles with our responsibility as a global city to combat climate change. Los Angeles has been a global climate leader for decades, achieving major milestones, from cleaner air to becoming a coal-free city. Still, as climate change intensifies extreme heat, wildfires, drought, and flooding, there is more work to do, both to curb emissions and to prepare Angelenos to cope with and adapt to these changes.

Principles & Values

To confront the climate crisis, we are committed to implementing high-impact, equitable, and sustainable solutions that deliver widespread benefits. We will drive climate action with the following principles and values:

- Act with urgency to confront the climate crisis
- Center equity and environmental justice
- Improve health, resilience, and quality of life across all neighborhoods
- Prioritize high-road jobs and inclusive economic growth
- Commit to transparency and accountability

Plan Structure

We have organized this plan around four overarching goals that define our vision for a resilient, climate-safe future and emphasize that climate solutions are cross-cutting and intersectional:

1. LA will be a clean, connected, and healthy city that improves the quality of life for all Angelenos.
2. LA will be home to climate-resilient neighborhoods where people and nature can thrive.
3. LA will be a thriving green economy with opportunity for all.
4. LA will be a global model of bold and equitable climate leadership.

To translate these visions into reality, the plan includes 14 objectives that outline our strategic roadmap, along with over 50 targets and actions designed to deliver concrete, measurable climate outcomes.

From Plan to Implementation

To maximize benefits for Angelenos and City resources, we prioritize cross-departmental, multi-benefit projects. Driving this approach, the Mayor convened a Climate Cabinet of 14 key City departments dedicated to delivering urgent, equitable climate action. The Cabinet oversees departmental progress through regular tracking and public reporting. By embedding climate goals directly into City budgeting and planning, the City is taking a strategic, collaborative, and resourceful approach to a sustainable future. Beyond City leadership, the Mayor engaged with community experts and stakeholders, recognizing that successful local climate action requires broad external partnerships.

Goal 1:

LA Will Be a Clean, Connected, and Healthy City that Improves Quality of Life for All Angelenos

OBJECTIVES	TARGETS/ACTIONS
Objective 1: Deliver clean, affordable energy to every Angeleno by expanding renewable energy, rooftop solar, community solar, and battery storage to lower utility bills, improve reliability, and cut emissions.	a. Increase renewable energy from 30% (2017 baseline) to 80% by 2030 and 100% clean energy by 2035. b. Double local solar from the 2024 baseline to 1,504 megawatts by 2030 while prioritizing disadvantaged communities and advancing distributed energy resources. c. Expand demand response to 340 megawatts by 2031 (a 400% increase from current capacity) and add 300 megawatt-hours of local energy storage capacity by 2035 to improve grid reliability.
Objective 2: Make buildings carbon-free by improving efficiency, electrifying homes, and setting strong performance standards to cut energy costs, improve indoor air quality, and reduce pollution.	a. Work with the City Council to develop and adopt new policies to achieve net-zero carbon for new buildings and reduce the carbon footprint of existing buildings by 2026. b. Increase energy efficiency by 15% from a 2020 baseline by 2030. c. Reduce the average carbon intensity of the materials used in new building construction by 40% by 2035. d. Reduce municipal building greenhouse gas emissions and energy use to support the achievement of the City's Carbon Neutrality goal to be net zero by 2035.
Objective 3: Accelerate the shift to a zero-emissions, connected, and equitable transportation system so getting around is cleaner, cheaper, and healthier for all Angelenos.	a. Electrify 100% of Los Angeles Department of Transportation transit buses by 2028, and coordinate with Metro to accelerate its full bus electrification timeline. b. Transition light-duty City-owned fleet vehicles to zero emission by 2030 and convert feasible medium/heavy-duty City-owned fleet vehicles to zero emission by 2030. c. Install 120,000 public and multifamily charging ports by 2030, and ensure the Bureau of Street Lighting installs 10,000 of these chargers in disadvantaged communities. d. Increase the number of used electric vehicle rebates delivered in disadvantaged communities from approximately 6,000 (2026 baseline) to 10,000 by 2030.
Objective 4: Reduce transportation-related emissions by promoting walkable neighborhoods and alternate forms of transportation to reduce car trips.	a. Reduce vehicle miles traveled per capita by 5% below the regional average from the 2023 baseline by 2035. b. Increase the number of people walking, biking, using micromobility, matched rides, or public transit for their commutes to at least 24% by 2035, prioritizing investments in disadvantaged communities.
Objective 5: Cut pollution from goods movement and major transportation hubs to protect the health of communities near ports, airports, and freeways.	a. In 2026, execute and track the Port of Los Angeles Clean Air Action Plan (CAAP) with additional quantifiable measures (CAAP-Plus) to reduce port-related greenhouse gas emissions 40% below 1990 levels by 2030. b. Allocate \$200 million on zero-emission truck and infrastructure incentives by 2028 to ensure the Port of Los Angeles will achieve 100% zero-emission drayage trucks by 2035. c. Ensure the timely delivery of the Zero Emissions Port Electrification and Operations project, adding at least 200 megawatts of power to the Port marine terminals to ensure the Port can transition all terminal equipment to Zero Emission by 2030. d. Continue implementation of the Ports of Los Angeles and Long Beach - Singapore and Shanghai Green Shipping Corridors to assist the transition of energy used by ships to zero or near-zero greenhouse gas emission technologies, with deployment of low-carbon ships to the Port by 2030. e. Partner with airlines, fuel suppliers, and end-users to increase Sustainable Aviation Fuel use at LAX and Van Nuys Airport targeting a 28% increase from a 40-million-gallon baseline (2024) by 2030. f. Convert 100% of the Los Angeles World Airports sedan fleet to zero-emission and expand electric vehicle charging to 1,200 stations for employees and passengers by 2035. Deploy transportation demand management strategies to reduce vehicle miles traveled through employee commutes by achieving a 10% participation rate in Transportation Management Organization programming by 2035.

Goal 2:

LA Will Be Home to Climate-Resilient Neighborhoods Where People and Nature Can Thrive

OBJECTIVES	TARGETS/ACTIONS
Objective 6: Enhance and connect green spaces and ecosystems across the city to strengthen neighborhood resilience, restore biodiversity, and promote wellbeing for people and nature.	a. Replace non-functional turf in City and commercial facilities and landscapes with California native or climate-adapted plants by 2027, prioritizing high-water-use sites and disadvantaged communities. b. Use at least 50% of locally produced compost and mulch within Los Angeles by 2030 to enhance soil health, support the growth of plants, improve stormwater infiltration, and increase carbon storage. c. Establish five new parks in priority neighborhoods identified by the Park Needs Assessment, by 2030, and 10 by 2035, to provide park access to the top 25% of highest-need residents currently lacking it. d. Increase overall tree canopy cover to cover 25% citywide by 2035, ensuring at least 15% canopy in all neighborhoods, and prioritizing heat-vulnerable communities. e. Increase the City of Los Angeles' Biodiversity Index Score 35% by 2035 from the 2022 baseline.
Objective 7: Reduce risks from extreme heat, drought, wildfire, and flooding by scaling nature-based solutions, green infrastructure, and community-driven strategies that make neighborhoods safer, healthier, and more resilient.	a. In 2026, implement fire-resistant construction and site standards in Very High Fire Hazard Severity Zones, and ensure public facilities incorporate resilient, fire-safe design and defensible space. b. Release the Los Angeles Community Wildfire Protection Plan with community input by 2026 and implement recommendations to reduce wildfire risks and protect communities. c. By 2027, integrate the Climate Vulnerability Assessment to guide City Budgeting, Capital Planning, and community planning to ensure City investments address disproportionate impacts from climate change. d. Adopt and implement the City's first Heat Action and Resilience Plan by 2027 to reduce exposure, protect residents, and safeguard infrastructure. e. Develop a network of resilience centers that provide residents with shelter, communications, and resources during a climate emergency and prioritize communities most vulnerable to climate change by 2027.
Objective 8: Phase out urban oil and gas drilling and clean up sites so land can be safely reused for housing, parks, and community benefit.	a. Adopt an Oil and Gas Drilling Ordinance in 2026 that prohibits new oil and gas extraction, and establishes the process to terminate existing oil and gas extraction across the city. b. Issue and implement the Department of City Planning's new measures for land remediation and oil well abandonment that address the environmental impacts from oil operations when multi-family housing is built in sensitive areas in 2026.
Objective 9: Ensure sustainable and equitable water systems through conservation, stormwater capture, and recycled water to secure local and reliable supplies, protect ecosystems, and support community resilience.	a. Reduce per capita potable water use from 133 gallons per capita per day by 25% by 2035. b. Source 70% of Los Angeles' water locally by 2035 and reach total stormwater capture capacity of 150,000 acre-feet per year (supporting water for approximately 1.8 million Angelenos) by 2035 to help replenish groundwater and improve water quality. c. Increase the number of multi-benefit stormwater capture projects from 42 projects in 2018 to 100 by 2035, leveraging Measure W funding and prioritizing disadvantaged communities. d. Increase recycled water for beneficial use from 27% (Fiscal Year 2017–18 baseline) to 45% by 2040, and complete the PureWater Los Angeles plan in 2026 to improve water reliability and support climate resilience. e. Reduce municipal water use from the 2013 baseline by 30% by 2035 and maintain or improve reductions thereafter.
Objective 10: Advance a zero-waste, circular economy by reducing trash, composting organics, and reusing materials to cut pollution, save resources, and reduce emissions.	a. Conduct a citywide waste characterization study by 2027; develop a circular economy plan by 2029 to identify and implement additional waste reduction. b. Reduce per capita solid waste generation by at least 15% by 2030 from approximately 19.8 pounds per person per day to 16.8 pounds per person per day, including phasing out of single-use plastics by 2032. c. Eliminate organic waste going to landfills by 2035.

Goal 3:
LA Will Be a Thriving Green Economy with Opportunity for All

OBJECTIVES	TARGETS/ACTIONS
Objective 11: Create high-road green jobs and expand access to training and apprenticeships that provide stable careers, family-sustaining wages, and pathways into the green economy for all Angelenos as we move toward a climate-resilient future.	a. In 2026, launch a workforce development pilot program to train workers for high-road jobs focused on land restoration and climate adaptation techniques to conduct vegetation management in the Wildland-Urban Interface around high fire risk zones. b. Adopt and implement departmental green workforce plans across the City by 2028 to align recruitment, hiring, and upskilling with the City's Climate Goals, prioritizing graduates of the City's green pathway programs, recently arrived immigrants, first-generation college students, people experiencing homelessness, justice-impacted communities, and other underrepresented populations. c. Train over 400 people annually in the City's career pathway programs in green sectors, prioritizing equity-focused training and apprenticeships. d. Increase green jobs to 165,000 by 2028, 220,000 by 2030, and 320,000 by 2035 through City programs, from a baseline of 118,000 in 2026.
Objective 12: Grow Los Angeles' green business sector by encouraging private investment, sustainable practices, and entrepreneurship that keep wealth and opportunity in our communities.	a. In 2026, launch program to provide upfront capital for building retrofits and other green infrastructure investments to increase the number of green infrastructure projects in the City. b. Integrate the City's Climate Budget process to align with City climate goals and greenhouse gas reduction strategies starting in Fiscal Year 26–27. c. Increase Green Business Certifications from 280 businesses in 2024 to 1,000 by 2028.

Goal 4:

LA Will Be a Global Model for Bold and Equitable Climate Leadership

OBJECTIVES	TARGETS/ACTIONS
Objective 13: Make the 2028 Games and other major events models of sustainability through ambitious goals for clean energy, water, transportation, waste, and heat protection to leave a lasting legacy of cleaner air, greener infrastructure, and healthier communities.	a. Through the Games Energy Council, maximize clean energy for Olympic & Paralympic venues by 2028. b. Ensure 100% of concession containers and foodware are reusable, recyclable, or compostable for the 2028 Olympic & Paralympic community events to advance Los Angeles' commitment to phase out single-use plastics. c. Reduce food waste at 2028 Olympic & Paralympic community events through edible food recovery, and expand composting and recycling access. d. Host a Transit-First Games in 2028 by deploying zero-emission buses, expanding micro-mobility access, and enhancing active transportation routes to connect venues and events throughout the City—ensuring legacy transit upgrades in underserved neighborhoods.
Objective 14: Create a lasting climate legacy from mega-events by embedding sustainability, equity, and resilience practices into City policies, programs, and partnerships — ensuring that Los Angeles' role as host strengthens long-term climate leadership, community benefits, and global influence.	a. Integrate shade structures, new shade trees, hydration stations, misting fans, and other functional cooling strategies around Olympic & Paralympic venues and community events by 2028 to protect the health and safety of workers, volunteers, participants, and spectators from extreme heat. b. Expand the existing City facilities zero-waste ordinance for the 2028 Olympic & Paralympic Games to include all City-sponsored events.

Introduction

Why this plan?

Los Angeles is working hard to implement a resilient, climate-safe city where every Angeleno thrives. The Mayor's vision is to create neighborhoods that are safe, healthy, and prepared for the impacts of a changing climate, from extreme heat and wildfire to flooding and drought. A climate-safe Los Angeles means protecting lives and livelihoods while ensuring that every community benefits from clean air, reliable energy, sustainable mobility, and access to green and cool spaces. The vision builds on decades of environmental progress and community leadership, recognizing that resilience must include people as well as the natural systems that sustain us. Thriving in a changing climate requires more than reducing emissions: it means improving quality of life, strengthening local economies, and restoring trust through visible results in every neighborhood.

With this plan, the City will deliver urgent, equitable climate action that improves daily life in our neighborhoods, protects against future risks, and builds a fair, green economy. The Mayor's Office developed this operational framework to translate the City's ambitious climate targets into coordinated, measurable, and immediate action.

Through this framework, the Mayor is prioritizing:

- Continued Leadership: Building on the City's historical leadership on climate action, focusing on implementation with City departments.
- Accelerated Progress: Focusing on specific departmental actions that will speed up progress toward a safer, cleaner, and more equitable city.
- Accountability & Urgency: Emphasizing accountability and the urgent need for City actions that reduce greenhouse gas (GHG) emissions, enhance community resilience, and deliver tangible benefits to residents.
- Equity Focus: Aligning investments and partnerships to address disparities in health, infrastructure, and opportunity, specifically for communities historically burdened by pollution and underinvestment.
- Unified Framework: Ensuring that Los Angeles' path to carbon neutrality simultaneously builds economic opportunity, improves public health, and strengthens neighborhood resilience by integrating the work of departments and weaving together Los Angeles' other planning efforts.

This plan prioritizes actions rooted in the following core principles and values to ensure a climate future that benefits every Angeleno.

We act with urgency to confront the climate crisis.

Los Angeles is already experiencing intensifying climate hazards, including extreme heat, wildfire, flooding, and drought. The City recognizes that climate change is an immediate public health, economic, and equity crisis that demands rapid, coordinated action. This plan embeds urgency in implementation timelines, budget decisions, and departmental accountability to ensure near-term results. Departments are moving from planning to action, accelerating deployment of climate solutions that protect communities today while building resilience for tomorrow.

We center equity and environmental justice.

Equity is the foundation for our climate investment. The City prioritizes actions that reduce burdens on frontline communities, address historic underinvestment, and ensure fair access to clean air, energy, water, mobility, and green space. Through the Climate Cabinet and departmental planning processes, the City integrates tools like CalEnviroScreen, the City Administrative Officer (CAO)'s Measure of Access, Disparity, and Equity index and tool, and community-driven engagement to target investments where they are most needed. This principle aligns with the City's broader climate justice commitment: a transition that is fair, inclusive, and community-informed.

Introduction

We improve health, resilience, and quality of life across every neighborhood.

Every climate action in this plan aims to make neighborhoods safer, cooler, and healthier. Investments in nature-based infrastructure, renewable energy, clean mobility, and housing resilience reduce exposure to pollution and extreme weather. The City recognizes that public health and climate resilience are interdependent. Clean air, shade, and access to parks are as essential as reliable energy and water. Departments will identify co-benefits that enhance daily life and close health disparities citywide.

We prioritize high-road jobs and inclusive economic growth.

The transition to a zero-carbon city must also be a just transition for workers and communities. Climate action expands career pathways, union jobs, and local entrepreneurship in the green economy. City departments are to align workforce development, procurement, and contracting to advance equitable hiring and training standards. This principle ensures climate progress strengthens Los Angeles's economic foundation while uplifting those historically excluded from opportunity.

We commit to transparency and accountability.

Accountability is a key component of effective implementation. Departments report progress through the Climate Cabinet and in annual public updates, supported by clear metrics and interdepartmental coordination. Regular meetings with stakeholders to gain input and feedback are an important way to ensure accountability. Transparency in climate budgeting, project delivery, and performance tracking builds public trust and drives continuous improvement of City operations. We are reinforcing that success will be measured not only by goals achieved but by how equitably and effectively we meet those goals.

Introduction

Plan development

The Mayor's Office developed this plan through a collaborative process with the Mayor's Climate Cabinet, City departments, and ongoing engagement with community-based organizations, businesses, and researchers. We first reviewed the [2019 LA's Green New Deal](#) targets to assess the City's progress toward existing goals and identify targets to be refined, updated, expanded, or maintained. Over the past five years, we've made substantial progress, building on decades of climate leadership, resulting in reduced emissions from our buildings, transportation, and waste; expanded access to parks and green spaces; and investments to become more resilient and to grow a local green economy.

Here, we are weaving together past and current plans and taking stock of our progress to date to present a comprehensive, high-level roadmap. We point to critical related planning efforts across the City departments—from Los Angeles Department of Water and Power (LADWP)'s plan for clean energy (LA100), to Department of Recreation and Parks (RAP)'s extensive Parks Needs Assessment, to the forthcoming heat plan led by Emergency Management Department (EMD)—as vital components for a sustainable and resilient Los Angeles.

Throughout the planning process, the Mayor's Climate Cabinet played a central leadership role, bringing together General Managers, Department Chief Sustainability Officers, and senior leadership from 14 City departments to ensure coordination across the city and accountability for our shared outcomes. To advance the Climate Cabinet's priorities, the Mayor's Office convened eight cross-departmental working groups focused on key issue areas, including nature-based solutions, environmental and climate justice, extreme heat, transportation electrification, water resilience, and building decarbonization. These working groups highlighted challenges, identified gaps in existing policy, and amplified strategies that will ensure Los Angeles achieves its climate goals.

The Mayor's Office also engaged with over 40 community organizations, advocates, and researchers to ground the targets in community priorities. Organizations provided feedback through individual meetings and workshops. This iterative process ensures that the plan reflects both what the City can deliver and what Angelenos need to thrive in a rapidly changing climate.

This plan defines a vision for a climate-resilient future. Institutionalizing climate accountability will be critical to reaching these goals. To achieve our long-term carbon neutrality goals, in 2024, the Los Angeles City Council instructed the City Administrative Officer (CAO) to develop a technical Climate Action and Adaptation Plan (CAAP) that examines City efforts—particularly targets outlined here—to be carbon neutral by 2045. Our offices are working in close alignment to ensure these planning efforts are fully integrated and actionable.

Introduction

City of LA's climate planning

The City of Los Angeles has a long history of developing ambitious climate and sustainability goals. The plan builds off these initiatives and weaves together several existing and future climate plans for the City. These diverse strategies ensure that the City of Los Angeles is setting a clear course for a more livable and sustainable Los Angeles.

Climate Reality in Los Angeles

To understand how Los Angeles must act, we must first understand how climate change is, and will be, impacting Angelenos. The City developed a comprehensive study to identify the climate hazards facing Los Angeles and highlight the people, places, and systems most vulnerable to them. The 2024 Climate Vulnerability Study (CVA) encompasses climate hazards impacting the city, including extreme heat, wildfire, drought, extreme precipitation, sea level rise, flooding, and climate-related public health.

Climate Reality in Los Angeles

Extreme Heat

Extreme heat is one of Los Angeles's most dangerous climate hazards, and it will become more severe due to climate change. In Los Angeles, climate change means more 90°F days, longer heat waves, hotter inland neighborhoods, more ER visits and deaths, and billions of dollars lost in wages¹. On a hot summer day, temperatures in inland communities can be 15 to 30°F higher than coastal areas, exposing them to dangerous temperatures while others experience more moderate weather². Nights will also be warmer, meaning less relief for residents. In some neighborhoods, nights above 80°F would occur more than 20 times a year by century's end, significantly increasing health risks³. Differences in housing conditions, neighborhood tree canopy, and access to cooling magnify these disparities. Sensitive populations include older adults, children, individuals with chronic medical conditions, individuals experiencing economic hardship without access to cooling, people who overexert themselves outdoors, and individuals experiencing homelessness⁴.

Wildfires

City of Los Angeles

Socially Vulnerable Population in the Wildfire Hazard Area

Drought

Since 2000, Los Angeles has experienced more frequent and prolonged droughts. Projections show droughts will become more common, longer, and more severe due to hotter temperatures and shifts in seasonal rainfall. Historical droughts are projected to become about 15% more severe by mid-century⁶. These changes threaten water supplies, groundwater recharge, urban trees, and landscape irrigation, while also increasing fire risk and pressure on household water bills. Los Angeles imports a large portion of its water supply from the Sierra Nevadas, the Colorado River, and Northern California. In dry years, imported water availability is projected to decline by approximately 7% by mid-century and 13% by the end of the century under current conditions⁷. As drought intensifies, Los Angeles will face increased pressure on local water management systems, requiring more conservation strategies and storage capacity.

Climate Reality in Los Angeles

Precipitation, Sea Level Rise & Flooding

Flooding in Los Angeles is both a coastal and neighborhood-level issue, where flood exposure, aging infrastructure, inadequate drainage, and financial burdens combine to create increased vulnerability. As climate change intensifies, Los Angeles faces increased risks from extreme precipitation, sea level rise, and flooding as rainfall patterns and storm intensity shift. Warmer air holds more moisture, which means storms are expected to be more intense when it does rain. By mid-century, the wettest day of the year in Downtown Los Angeles is projected to bring 3.5 inches of rain, which is about 12% more than the historical average and nearly 26% more by the end of the century⁸. These intense storms can overwhelm stormwater

systems and damage roads, particularly in neighborhoods with high levels of impervious surfaces⁹.

Sea level rise also poses a chronic risk of flooding for Los Angeles's coastal areas. Higher sea levels will amplify the impact of high tides, storm surge, and wave runup, making coastal flooding more frequent and severe even during moderate storms. Low-lying coastal areas, including neighborhoods near Venice, Wilmington, and the Port of Los Angeles, face increasing risks from sea level rise¹⁰. Sea level rise poses long-term risks to housing stability, public access to beaches, and the city's critical infrastructure, such as ports, wastewater treatment facilities, and transportation corridors¹¹.

Sources of Pollution

While we adapt to the climate changes we are already experiencing, we must also curb emissions to slow the pace and intensity of that change. The way we, as a community, power our buildings, move people and goods, and manage waste generates greenhouse gas (GHG) emissions. While the City directly controls some of these sources—such as municipal buildings, fleets, and waste services—most emissions come from activities across the city that require collaboration, policy alignment, and investment beyond City operations. In 2023, power generation, city fleet operations, solid waste, and buildings and facilities generated most of the City of Los Angeles’ operational emissions. As far as non-city operations, stationary energy, transportation, and waste sectors produce the majority of citywide emissions.¹²

Sources of Climate Pollution

Community and Municipal Greenhouse Gas Inventory Reports. 2023.

Source: City of Los Angeles, Bureau of Sanitation.

Stationary energy represents emissions from energy generation and consumption in buildings (residential, commercial, and industrial), such as electricity, heating, and cooling. Transportation includes emissions from on-road vehicles, public transit, and related mobile sources operating within city boundaries. Waste covers landfill emissions and waste management processes that generate greenhouse gases, particularly methane from organic waste decomposition.¹²

Centering Climate Justice

Climate change exacerbates existing inequities experienced by disadvantaged communities. Communities that are often hit first and worst by climate change face the greatest vulnerability and potential for harm. When existing stresses from the high costs of housing, energy, and transportation place a heavy burden on families and individuals, it becomes more challenging to cope with and adapt to rising temperatures, flooding, wildfires, and drought conditions.

Los Angeles is centering environmental and climate justice by directing climate investments and grants toward these high-need communities. With once-in-a-generation climate events becoming more frequent, this disproportionate impact of climate change is something Angelenos know all too well. Aligning climate investments to communities experiencing disproportionate harm directly supports the advocacy that community leaders have carried out for decades.

To address historical inequities, we must acknowledge the disparities that still exist and develop an intentional framework to prioritize the health and well-being of all Angelenos. We are committed to the principles of climate justice and ensuring affordable and accessible climate programs across our city.

To achieve this vision, we prioritize the following equity criteria:

- Ensure fair and equitable distribution of resources
- Provide affordable access to climate programs and clean technologies
- Direct funding investment in community-based infrastructure and programs
- Develop a local high-road green workforce and job opportunities
- Elevate community voices in climate program design and implementation
- Couple climate investments with anti-displacement protections for renters and small businesses

To ground the four goals and 14 objectives in this equity-centered approach, we amplify equity impacts and priorities throughout the plan. Our commitment to climate justice initiatives ensures climate programs are equitably distributed and address historical inequities still present today.

Plan goals and structure

LA's 2019 Green New Deal set ambitious targets for a carbon-free and resilient Los Angeles. Today, we remain committed to this path of urgent climate action and to reaching carbon neutrality by 2045. To keep us on course, we are assessing our successes and challenges and refreshing our targets and next steps. In turn, we are presenting an update of LA's Green New Deal targets, leading with ambition while accounting for feasibility, funding, and the current regulatory context.

We organize the plan around four goals that envision a future Los Angeles as a clean and healthy city, home to resilient neighborhoods and a strong local green economy, benefiting Angelenos and leaving an environmental legacy for future generations. Across the four goals, we outline 14 objectives that set the City up with a roadmap for successful implementation.

Over the next ten years, we are prioritizing high-impact, multi-benefit, and immediate actions that create measurable change. By grounding our implementation in equity, we ensure fair, inclusive, and community-informed outcomes. We have developed new targets and refined the LA's Green New Deal targets to concentrate on cross-cutting climate actions and areas where the City can drive the greatest impact.

The **52 targets** in this plan reflect a combination of new, revised, and maintained commitments:

- 16 new targets to address gaps in existing climate efforts and reflect ongoing city initiatives.
- 36 updated LA's Green New Deal targets to accelerate timelines (due to ambitious departmental work), update their scope, or align deadlines with departmental capacity.
 - 10 targets revised to accelerate the timeline or increase outcomes.
 - 14 targets revised to align the framework and methodology for monitoring the work.
 - 7 targets revised because they were behind schedule.
 - 5 maintained targets as departments are working to achieve these five original targets.

Collectively these targets are focused on staying the course to reach our carbon neutrality and resilience goals and reflecting and refining, keeping this plan as a living document.

52 TARGETS

16

New Targets to address gaps in existing climate efforts and reflect ongoing city initiatives.

36

Updated LA's Green New Deal targets

to accelerate timelines (due to ambitious departmental work), update their scope, or align deadlines with departmental capacity.

10

targets revised to accelerate the timeline or increase outcomes.

14

targets revised to align the framework and methodology for monitoring the work.

7

targets revised because they were behind schedule.

5

maintained targets as departments are working to achieve these five original targets.

GOAL 1: LA Will Be a Clean, Connected, and Healthy City that Improves Quality of Life for All Angelenos

Los Angeles is progressing toward a healthier city by reducing GHG emissions and other pollutants, leading to cleaner air and improved quality of life. The City is working to curb climate change by transitioning to 100% renewable energy, ensuring buildings are energy-efficient, expanding public transit and mobility options, and targeting vehicle emissions. Reducing emissions also provides opportunities for economic growth, fostering a green economy, and creating high-road green jobs.

Where We Are Now

Los Angeles has reduced emissions by transforming how energy is generated and supplied to Angelenos. In a span of 20 years the City phased out coal from its energy supply from 50% coal to zero and increased its clean energy mix from 3% to 60% clean energy. Coupled with this transition, we are taking steps to ensure our buildings emit less—from construction to operations—and are healthy spaces for residents to live, work, and thrive. We have also made significant investments in public transportation, shared mobility, bus electrification, and support for clean vehicles on the road. In addition, the Port of Los Angeles (POLA) is electrifying its transportation and equipment, and Los Angeles World Airports (LAWA) is improving access to its terminals to reduce pollution and ensure reduced travel times.

Where We Will Be

Los Angeles was a city layered in smog. We have made significant gains in improving air quality and reducing the harmful effects of climate change—and are continuing our efforts to make Los Angeles a place with healthy air quality and clean, reliable, non-polluting transportation. A place where industrial prosperity does not mean increased pollution and lingering emissions. These actions mean fewer unhealthy air quality days, fewer warnings to stay indoors, and less pollution drifting into homes, schools, and playgrounds in communities that live near port, airport, and freight routes.

Equity Impacts

Access to clean, reliable, and affordable energy is not equal across Los Angeles. To bridge this gap, the City is prioritizing energy equity by retrofitting older buildings, expanding access to rebates, and replacing polluting appliances in pollution-burdened neighborhoods. This goal directs clean energy investments—from rooftop solar to electric buses—to communities facing the highest health and financial costs.

Key climate equity initiatives include:

- **Expanded Residential Solar Access:** LADWP is implementing Virtual Net Metering and Shared Solar programs, allowing renters in apartments and multi-family buildings to benefit from renewable energy.
- **Rooftop Solar Incentives:** The Solar Rooftops program allows homeowners to host LADWP-installed solar panels in exchange for rate discounts.
- **Affordable Housing Energy Upgrades:** LADWP's Comprehensive Affordable Multifamily Retrofits (CAMR) program supports appliance upgrades in disadvantaged communities while requiring anti-displacement commitments from owners.
- **Infrastructure & Green Transportation:** The City is investing in electric buses and adding charging stations to light poles in underserved communities.
- **Emission Reductions:** Investments in cleaner trucks, port/airport equipment, and electric charging systems aim to reduce diesel exhaust in pollution-burdened neighborhoods near industrial facilities, as well as at our port and airports.

Who Will Get This Done

The Mayor will ensure City departments limit emissions from our power grid, buildings, transportation, and goods movement:

- LADWP will continue to deliver clean and affordable energy to every Angeleno through investments in renewable energy, local solar, energy storage, demand response, and EV charging infrastructure.
- The Bureau of Street Lighting (BSL) will continue to install solar street lights and expand public curbside charging for electric vehicles.
- The Department of Building and Safety (DBS), working with LADWP, will ensure that we continue to make strides in lowering building emissions.
- The Bureau of Engineering (BOE) will lead efforts to reduce emissions from City facilities.
- Los Angeles Department of Transportation (LADOT) and Los Angeles City Planning (City Planning) will ensure that we can maximize our transition to clean transportation options and work with LADWP to develop a reliable charging infrastructure.
- The General Services Department (GSD) will build out electric charging infrastructure for City-owned fleets and facilities.
- POLA will continue to make strides in lowering emissions at the Port and enhance the electrification of goods movement and equipment.
- LAWA will continue to improve access to the Los Angeles International Airport (LAX) and limit emissions in its operations.

Objective 1:

Deliver clean, affordable energy to every Angeleno by expanding renewable energy, rooftop solar, community solar, and battery storage to lower utility bills, improve reliability, and cut emissions.

We are committed to a 100% renewable grid by 2035. Los Angeles reached a major milestone by becoming coal-free in December 2025, marking a significant shift in how the city generates electricity. This progress reflects years of planning and analysis by LADWP, including the LA100 Plan, which examined how the City could transition to 100% clean energy

while maintaining reliability and managing costs. Guided by the LA100 Plan, we are also preparing for rising energy demand to support the electrification of our buildings and transportation, as well as the energy and water needs of data centers driven by new technologies.

Objective 1: Clean & Affordable Energy - Targets & Actions

1a

Increase renewable energy from 30% (2017 baseline) to 80% by 2030 and 100% clean energy by 2035.

The City is committed to transitioning to clean, carbon-free energy sources such as sunlight, wind, and hydropower, which are naturally replenished and do not emit climate-warming emissions. This commitment will ensure that everyday activities, such as turning on lights, cooling homes, or charging phones and electric vehicles (EVs), no longer contribute to climate change. The LA100 Plan provides a roadmap for achieving a clean energy future based on the core principles and key considerations of environmental benefits and equity, reliability and resiliency, and affordability and rate impacts.

Progress:

- In 2026, over 40% of the City's electricity comes from renewable sources, and over 60% is carbon-free.
- The Intermountain Power Project (IPP) shutdown in 2025 marked a major step toward a clean energy future, completing the City's transition away from coal-fired electricity. IPP was the largest stationary-facility source of GHGs in 2023, accounting for over 2 million tons of carbon emissions.
- The Eland Solar and Storage Center went online in 2025 and generates enough power to supply over 266,000 homes, accounting for 7% of the city's total energy consumption.

Double local solar from 2024 baseline to 1,504 megawatts (MW) by 2030 while prioritizing disadvantaged communities and advancing distributed energy resources.

Local solar means electricity generated close to where it is used, such as rooftop solar on homes, apartments, schools, and businesses, as well as shared solar projects that serve multi-family households. Expanding local solar allows Los Angeles to meet growing energy demand with clean power that benefits customers directly. Prioritizing disadvantaged communities ensures these benefits reach residents who have faced higher energy costs, greater pollution, and fewer opportunities to participate in the clean energy transition.

Progress:

- In 2026, BSL is installing solar streetlights that will help deter copper theft, ensure consistent, safe lighting in neighborhoods, and lower energy costs.
- Los Angeles has installed more than 97,000 solar systems. In 2025, Los Angeles reached over 864 MW of customer and utility-built local solar, enough to power approximately 370,000 homes.
- LADWP is in the process of expanding local solar on City facilities up to 197 MW and on qualified residential homes up to 20 MW by 2036.
- The City has launched several [local solar initiatives](#), such as net energy metering, solar rooftop programs, feed-in tariff programs, and virtual net energy metering pilot, to ensure that Angelenos can benefit from installing solar.

Expand demand response to 340 MW by 2031 (a 400% increase from current capacity) and add 300 megawatt-hours of local energy storage capacity by 2035 to improve grid reliability.

Increasing demand response programs—programs that incentivize customers to reduce electricity use during high-demand times—helps ease pressure on the power grid when needed most. Reducing 1 MW of demand has the same effect as powering 250 homes, without producing pollutants or requiring costly new power plants. These programs reduce electricity use when needed, avoiding the need to build new power plants to accommodate peak electricity demand. Customers can use batteries to store electricity when energy demand is low and discharge it during peak times.

Progress:

- In 2025, LADWP delivered an average of 90 MW of demand response capacity through its Power Savings program and Commercial and Industrial program.
- As of 2025, 1,500 MW of local energy storage (batteries) has been installed in Los Angeles.
- LADWP launched the Commercial Energy Storage to Grid pilot program, the nation's first municipal utility vehicle-to-grid (V2G) and energy storage-to-grid program.
- LADWP offers the Self-Generation Incentive Program, providing financial incentives for income-qualified residential customers to install battery storage and solar systems.

Project Highlights

LA100 Plan

The heart and implementation plan for this objective is LADWP's LA100 Plan. Informed by a community advisory panel, this plan outlines Los Angeles' energy future. The LA100 Plan is a roadmap for providing reliable, sustainable electricity over a 20-year horizon while transitioning to a 100% carbon-free power supply by 2035. Through rigorous analysis and community outreach efforts, the LA100 Plan evaluates strategies in light of its objectives to identify the optimal resource combination that meets the utility's core mission of providing low-cost, reliable, resilient, equitable, and clean electric power service.

Objective 2:

Make buildings carbon-free by improving efficiency, electrifying homes, and setting strong performance standards to cut energy costs, improve indoor air quality, and reduce pollution.

Buildings and their energy needs account for 58% of carbon emissions in the City of Los Angeles. Reducing emissions in buildings lowers the city's carbon footprint, improves air quality, and allows us to control temperature in our homes and businesses. In turn, Angelenos can stay cool during heat waves and continuously improve their quality of life. The City is also committed to reducing construction emissions,

ensuring we use sustainable materials, and improving site conditions for construction workers by limiting equipment pollution. To achieve this objective, the City is considering both regulations and incentives to ensure that new and existing building construction leads to reduced environmental impact and efficient operations.

Objective 2: Carbon-Free Buildings - Targets & Actions

2a

Work with City Council to develop and adopt new policies to achieve net-zero carbon for new buildings and reduce the carbon footprint of existing buildings by 2026.

The City is developing recommendations on limits for building emissions in new construction. To address emissions in existing buildings the City is also developing a Building Performance Standard (BPS), an outcome-based policy that requires existing large buildings to meet progressively stricter targets for energy use or emissions over time. Together, these two policies will help reduce GHG emissions in our buildings.

Progress:

- DBS is drafting an ordinance to reduce operational emissions from new building construction by promoting the use of electric appliances.
- BOE is integrating energy efficiency and electrification into City-owned building projects and capital planning.
- The LADWP Zero by Design program provides incentives for multifamily zero-carbon new construction projects.
- In 2025, LADWP launched the pilot Home LA program, offering incentives for all-electric homes for those rebuilding after the Palisades fire.

2b

Increase energy efficiency by 15% from a 2020 baseline by 2030.

Buildings account for a large share of energy use in Los Angeles, powering everyday needs such as lighting, heating, cooling, refrigeration, and appliances. Increasing energy efficiency is critical as the city grows and experiences more extreme heat, which increases demand for air conditioning and strains the power grid. By focusing on efficiency across building types, this target ensures that energy savings are built into daily life and supports a cleaner, more reliable energy system as Los Angeles moves toward its clean energy goals.

Progress:

- In 2020, the City achieved an increased efficiency of 3,408 GWh, which is enough to offset the electricity needs of nearly 564,000 homes.
- In 2017, DBS began implementing the Existing Building Energy and Water Efficiency (EBEWE) Ordinance, which requires privately owned buildings over 20,000 square feet to track and report energy and water usage and to improve energy and water conservation.
- DBS is working on an amendment to the EBEWE Ordinance to include a BPS Program, which requires existing buildings 20,000+ square feet to meet specific carbon emission and/or energy reduction targets. These targets can be reduced over time to achieve overall carbon reduction goals.
- LADWP has met and exceeded its 2010 through 2020 energy efficiency target of 15% percent cumulative energy savings - enough to offset the electricity needs of 564,500 homes and avoid over 1 million metric tons of GHG emissions.

2c

Reduce the average carbon intensity of the materials used in new building construction by 40% by 2035.

Embodied carbon is the total GHG emissions from the entire lifecycle of materials and construction, covering raw material extraction, manufacturing, transportation, construction, and demolition/disposal. It represents the "body" of the building's carbon footprint, locked in before the building is even used, and is a significant contributor to climate change. In 2021, California's concrete usage (77 million tons) emitted approximately 21 million tons of emissions, equivalent to 4.5 million cars' annual footprint. Reducing embodied carbon in buildings through low-carbon construction practices will reduce pollution and improve the health and well-being of manufacturers, construction workers, and building occupants alike.

Progress:

- As of January 1, 2026, the State of California Air Resources Board broadened its framework for requirements to limit embodied carbon, lowering the threshold for commercial buildings from larger than 100,000 square feet to 50,000 square feet, while maintaining requirements for school projects over 50,000 square feet.
- In 2026, the Adaptive Reuse Ordinance was revised to reduce carbon emissions by extending the lifespan of existing structures and minimizing new construction. This conversion process is projected to create at least 40,000 new housing units citywide.
- The City adopted Buy Clean California Act standards for key materials on municipal projects, such as steel, flat glass, and certain insulations, requiring Environmental Product Declarations and maximum global warming potential thresholds for City-funded projects.
- The Convention Center Remodel includes construction processes that will preserve resources and reduce waste, serving as an example of progress toward this target.

Reduce municipal building GHG emissions and energy use to support achievement of the City's Carbon Neutrality goal to be net zero by 2035.

The City manages a diverse portfolio of buildings, including libraries, recreation centers, fire stations, business offices, and maintenance yards. Many of these buildings have antiquated HVAC systems that emit significant amounts of pollutants. The City is implementing its work plan to reduce the carbon footprint of these buildings by installing solar panels and upgrading aging, inefficient appliances.

Progress:

- BOE developed a decarbonization plan for over 900 city facilities, prioritizing sites based on equity and replacement needs that is being implemented in conjunction with city departments
- LAWA is reducing emissions at LAX and Van Nuys Airport through audits, benchmarking, and solar expansion with an LADWP rebate partnership and asset replacement schedules.

Project Highlights

The Cypress Park Library

In 2025, the Cypress Park Library underwent significant upgrades in 2025 as the first of four pilot projects for the City's municipal building decarbonization efforts. These enhancements align with the City's climate goals, improve patron comfort, and reduce long-term operational costs. To eliminate onsite greenhouse gas emissions, the facility now features a smart building management system, high-efficiency LED lighting, and a modernized all-electric HVAC system. Critically, the installation of a new water heater and electric stoves eliminated greenhouse gas emissions from heating. The library also replaced fossil-fuel appliances with a new all-electric water heater and electric stoves. To further boost efficiency, the library installed high-performance window film to reduce thermal loss and configured lighting sensors to dim in response to occupancy and natural light levels automatically. Phase 2 of the project is currently in design and will introduce a new solar system on the roof and battery storage. The solar panels will generate clean, renewable energy, while the battery storage will provide four hours of emergency backup power. Collectively, these improvements create a more inviting, resilient, and sustainable environment for the community while significantly reducing the library's carbon footprint and utility expenditure.

Objective 3:

Accelerate the shift to a zero-emission, connected, and equitable transportation system so getting around is cleaner, cheaper, and healthier for every Angeleno.

For decades, gasoline and diesel vehicles have been a major source of air pollution, contributing to poor air quality, health risks, and high fuel costs, with on-road emissions accounting for 36% of community emissions. Vehicle electrification offers a direct and immediate way to reduce pollution while lowering operating costs and improving reliability. Los Angeles is making progress toward cleaner transportation

options by electrifying LADOT buses and investing in EV charging infrastructure. City departments have begun replacing gasoline and diesel fleet vehicles with electric alternatives, supported by the City's clean fleet procurement policy. Charging infrastructure is expanding in the city, with hundreds of fleet and public chargers already installed or in progress.

Objective 3: Zero-Emission Transportation - Targets & Actions

3a

Electrify 100% of LADOT transit buses by 2028, and coordinate with Metro to accelerate its full bus electrification timeline.

Buses are a critical part of daily life in Los Angeles, especially for residents who rely on public transportation to get to work, school, and essential services. This target commits the City to fully electrifying buses operated by the LADOT by 2028, while working with regional partners to accelerate bus electrification across the broader transit system.

Progress:

- LADOT currently operates more than 160 electric buses in its 444-vehicle bus fleet across its DASH and Commuter Express services, making Los Angeles one of the largest municipal operators of electric buses in the country.
- Electric buses serve high-ridership routes and corridors, reducing community exposure to traffic-related air pollution.
- At the regional level, the Los Angeles County Metropolitan Transportation Authority (Metro) is also advancing the deployment of zero-emission buses across its system.

Transition light-duty City-owned fleet vehicles to zero emission by 2030 and convert feasible medium/heavy-duty City-owned fleet vehicles to zero emission by 2030.

City-owned vehicles are on the road every day, providing essential services, from park maintenance and inspections to street repair, emergency response, and public works operations. This target commits the City to fully electrify its light-duty fleet and, where technology is ready, transition medium- and heavy-duty vehicles. The City will establish department-specific schedules for remaining classes to reach 100% as soon as technology/purchasing is available.

Progress:

- The City plans on expanding its EV fleet to approximately 3,250 by 2030, which includes all light-, medium-, and heavy-duty vehicles.
- As of 2024, GSD had installed 175 fleet chargers to support the transition to an electric fleet, in addition to the 250 publicly accessible chargers at City facilities. The City has also adopted a clean fleet procurement policy to align with state policy.
- The City has purchased and is piloting heavy-duty trucks, including hybrid bucket trucks, fire engines, and trash-collecting trucks.

Install 120,000 public and multifamily charging ports by 2030, and ensure BSL installs 10,000 of these chargers in disadvantaged communities.

As more Angelenos choose EVs, access to convenient charging is becoming as essential as access to gas stations once was. This target focuses on making charging easy to find and affordable for people who live in apartments, rely on street parking, or cannot install chargers at home. Expanding public and multifamily charging supports cleaner transportation while reducing one of the biggest barriers to owning or using an electric vehicle. Reaching this goal ensures that charging is available where people actually live, work, and travel, not just in wealthier neighborhoods or private garages.

Progress:

- After years of investment, Los Angeles is the city with the most public and commercial chargers available in the United States, with over 44,000 chargers currently installed.
- LADWP has supported charger deployment by providing over \$190 million in incentives since 2020, and ongoing investments to update the grid.
- BSL secured state funding to install 120 curbside chargers in Lincoln Heights and Boyle Heights and is advancing plans for 150 additional curbside chargers across the city.

Increase the number of used electric vehicle rebates delivered in disadvantaged communities from approximately 6,000 (2026 baseline) to 10,000 by 2030.

For many Angelenos, the cost of a new EV is still out of reach, even though electric cars are cheaper to fuel and maintain over time. This target focuses on making EVs more affordable by supporting the purchase of used EVs in neighborhoods with higher pollution burdens and fewer transportation options. Used EV rebates help households save money upfront, reduce monthly transportation costs, and avoid exposure to tailpipe pollution.

Progress:

- As of January 2026, nearly 6,000 used EV rebates have been issued to income-qualified customers, helping thousands of households switch to electric cars.
- In 2025, approximately 30% of all cars sold in Los Angeles County were electric or low-emission vehicles.
- Since 2018, LADWP provided over \$143 million in funding to support residential, commercial and used EV rebates.

Objective 4:

Reduce transportation-related emissions by promoting walkable neighborhoods and alternate forms of transportation to reduce car trips.

Transportation shapes daily life for every Angeleno, from commuting to work to getting groceries, visiting family, or reaching essential services. Reducing transportation emissions requires more than cleaner vehicles. It depends on making it easier, safer, and more practical for people to walk, bike, or ride transit. Los Angeles is already laying the groundwork for mode shift by investing in safer streets, better transit, and land-use patterns that support shorter trips. Guided by the Mobility Plan 2035 and a Complete Streets approach, the City continues to expand bike lanes, bus-only lanes, and pedestrian safety

improvements, particularly along corridors with high ridership and injury rates. LADOT's DASH and Commuter Express services provide essential transit in neighborhoods where many residents rely on buses for daily travel, while shared bikes, scooters, and first- and last-mile programs help residents complete short trips without a car.

Objective 4: Zero-Emission Transportation - Targets & Actions

4a

Reduce vehicle miles traveled (VMT) per capita by 5% below the regional average from the 2023 baseline by 2035.

VMT is a measure of how far people drive. Reducing VMT means fewer and shorter car trips because daily needs are easier to reach without a car. Numerous factors affect the City's average VMT, including land-use decisions, gasoline prices, vehicle parking availability and affordability, employment rates, the availability and affordability of transportation alternatives, and regional pass-through traffic. The City of Los Angeles updates their Transportation Demand Forecasting (TDF) model every five years following the update of the regional model led by the Southern California Association of Governments. The City's TDF model is used to forecast conditions, including VMT, in future years and to inform Community Plan Updates, land-use project review, and transportation project review. This target also focuses on improving how people move through the city by making walking, biking, and public transportation more practical, convenient, and safe for everyday trips. Land-use planning focuses on bringing housing, jobs, schools, and services closer together so residents can meet their daily needs with fewer, shorter trips.

Progress:

- The Transit-Oriented Communities (TOC) Incentive Program, Community Plan Updates, and Citywide Housing Incentive Program (CHIP) rezoning program encourage the construction of affordable housing near bus and train stations. The new units generated by the TOC incentives provide convenient options for low-income residents, add to the City's housing stock, and promote alternatives to car travel.
- LADOT launched the Mobility Plan 2035 implementation dashboard to track network implementation and Measure HLA Compliance.
- LADOT implemented priority bus corridor projects, such as the 22-mile Roscoe Boulevard project, and protected bicycle lanes, such as the 2-mile Hollywood Boulevard Safety and Mobility Project, which expanded the network of multimodal streets in the City of Los Angeles.

Increase the number of people walking, biking, using micromobility, matched rides, or public transit for their commutes to at least 24% by 2035, prioritizing investments in disadvantaged communities.

Mode share describes how people travel for daily trips, such as whether they walk, bike, take transit, or drive. Increasing the share of trips made by walking, biking, micromobility, matched rides, or public transit means more people can get where they need to go without relying on a personal car. This target focuses on improving everyday travel by making non-car options safer, more reliable, and easier to use. Shifting more trips to these modes helps reduce traffic, lower transportation costs, improve air quality, and support healthier lifestyles. Prioritizing currently underserved communities ensures that improvements reach neighborhoods where residents often face longer, more expensive trips and fewer safe travel options.

Progress:

- Since 2020, LADOT has added approximately 50 miles of peak-hour/full-time bus priority lanes, bringing the total to 71 priority lane miles since 1991.
- The City of Los Angeles has implemented an estimated 285 miles of the bike lane network, 22 miles of protected bicycle lanes, an enhanced network, 60 miles of the green network (Class I bike paths), and 108 miles of the Neighborhood Enhanced Network (Class III bikeways). These lanes will increase in 2026.
- LADOT requires permitted micromobility providers to establish discounted fares for low-income households.
- LADOT funds 65% of Metro Bikeshare operations' costs.
- In 2021, LADOT won a \$13.8 million award for a Universal Basic Mobility (UBM) to pilot a foundational level of safe, affordable, and accessible transportation for all people. This has provided over 250 e-bike rentals in disadvantaged communities, and over 1,900 rides on a free electric on-demand shuttle service, and 2,000 residents receiving \$1,800 over 12 months to spend on transportation services.

Objective 5:

Cut pollution from goods movement and major transportation hubs to protect the health of communities near ports, airports, and freeways.

Los Angeles is home to one of the largest ports and airports in the nation, serving as an economic engine for Los Angeles and far beyond. POLA is expanding operations—bringing in more goods and spurring green jobs and industries—while reducing port emissions. Similarly, LAWA, through its LAX Landside Access Modernization Program, is modernizing airport infrastructure to relieve traffic congestion and reduce transit commute time. Heavy truck traffic serving the Port and the large volume of vehicle trips to and from airports contribute to high levels of air pollution in nearby neighborhoods. These neighborhoods are

often lower-income communities with fewer options to avoid long-term exposure to unhealthy air. By cutting pollution from goods movement and major transportation hubs, we can both grow the local economy and improve air quality near homes and schools.

Objective 5: Goods Movement & Transportation Hubs - Targets & Actions

5a

In 2026, execute and track the Port of Los Angeles Clean Air Action Plan (CAAP) with additional quantifiable measures (CAAP-Plus) to reduce port-related GHG emissions 40% below 1990 levels by 2030.

POLA has ambitious goals to reduce its emissions, as set out in its original CAAP, approved in 2006 and updated in 2010 and 2017. A new CAAP-Plus initiative will build upon these goals and cover charging and fueling infrastructure on Port-managed properties. The initiatives will tackle emissions from cargo handling equipment, drayage trucks, local switcher locomotives, harbor craft, and ocean-going vessels. These new goals will be established as part of additions to a cooperative agreement between the South Coast Air Quality Management District and the Ports of Los Angeles and Long Beach to be finalized in 2026.

Progress:

- POLA aims to transition all cargo-handling equipment to zero emissions by 2030.
- POLA secured a \$412 million U.S. Environmental Protection Agency (EPA) Clean Ports Program (CPP) grant for cleaner operations, including over 400 pieces of electric cargo handling equipment, 250 electric drayage trucks, and 300+ chargers. POLA and its partners will match \$200 million, bringing the total project cost to over \$600 million. Additionally, POLA has allocated nearly \$100 million for trucks and infrastructure supported by the Clean Truck Fund Rate.
- Since the adoption of the 2006 CAAP, POLA has cut overall emissions of diesel particulate matter by 90%, sulfur oxides by 98%, and nitrogen oxides (NOx) by 73% while cargo increased by 38%.

5b

Allocate \$200 million on zero-emission truck and infrastructure incentives by 2028 to ensure the Port of Los Angeles will achieve 100% zero-emission (ZE) drayage trucks by 2035.

Drayage trucks that carry cargo to and from POLA are major sources of pollution in nearby communities, leading to negative health impacts. In response, POLA has committed to transitioning to 100% ZE drayage trucks by 2035, building on its Clean Truck Program and its CAAP. This target directs sustained investment toward trucks and infrastructure to reduce pollution, protect community health, and keep goods moving through the region while cleaning the air.

Progress:

- The Ports of Los Angeles and Long Beach have over 600 ZE trucks (battery-electric and hydrogen fuel cell) operating at the two Ports.
- As of 2025, POLA has collected nearly \$148 million through its Clean Truck Fund, which goes toward ZE Truck Vouchers, Joint Electric Truck Scaling Initiatives, Charging and Fueling Infrastructure, and other programs to encourage the transition to ZE trucking.

5c

Ensure the timely delivery of the Zero Emissions Port Electrification and Operations (ZEPEO) project, adding at least 200 MW of power to the Port marine terminals to ensure the Port can transition terminal equipment to Zero Emission by 2030.

As part of the San Pedro Bay CAAP goal of transitioning terminal equipment to Zero Emission by 2030, the ZEPEO project will develop LADWP electric grid infrastructure to add at least 200 MW of power to the Port marine terminals. ZEPEO includes expanding LADWP's Receiving Station, building three new Switching Stations, and constructing new LADWP Distribution Paths to each Port marine terminal. The ZEPEO project supports the U.S. EPA CPP grant to assist with the deployment of 424 pieces of ZE

cargo-handling equipment and 250 ZE drayage trucks. The initiatives are expected to reduce emissions by nearly 41,500 tons and NOx emissions by 55 tons annually.

Progress:

- POLA is working with the California Coastal Commission and LADWP to streamline permitting for ZEPEO projects within the LA Harbor District, ensuring infrastructure upgrades are delivered promptly.
- ZEPEO construction activities will start in 2027.

Continue implementation of the Ports of Los Angeles and Long Beach - Singapore and Shanghai Green Shipping Corridors to assist the transition of energy used by ships to zero or near-zero greenhouse gas emission technologies, with deployment of low-carbon ships to the Port by 2030.

International shipping is a major source of air pollution affecting communities near the San Pedro Bay ports, where large container ships burn fossil fuels as they travel, dock, and load cargo. Green Shipping Corridors provide a targeted strategy to cut pollution from global freight by focusing on specific trade routes and accelerating the use of cleaner fuels, vessels, and port operations. In collaboration with the San Pedro Bay ports, the Shanghai Municipal Transportation Commission, and international shipping partners, established a Green Shipping Corridor along one of the world's busiest trade corridors. Additionally, the San Pedro ports, along with the Maritime and Port Authority of Singapore, initiated a Green and Digital Shipping Corridor. By concentrating early clean-fuel deployment and advanced technologies on these routes, Los Angeles can reduce pollution where ships operate most frequently and deliver health benefits to nearby neighborhoods sooner.

Progress:

- The San Pedro Bay ports, with support from C40 Cities, commissioned a Clean Marine Fuel Feasibility Assessment, with publication expected by mid-2026.
- In 2026, the Ports of Los Angeles and Long Beach plan to issue a call for stakeholders to design a methanol bunkering pilot project to reduce emissions from traveling vessels.
- In 2025, expanded shore power infrastructure reached 100% capability in Shanghai, Los Angeles, and Long Beach, cutting emissions while ships are docked.
- Four reduced-carbon capable ships were deployed on the GSC between 2022 and 2024, operating on LNG.
- The first green methanol container ship to visit the United States made its first trip to POLA in August 2024.

Partner with airlines, fuel suppliers, and end-users to increase Sustainable Aviation Fuel (SAF) use at LAX and Van Nuys Airport, targeting a 28% increase from a 40-million-gallon baseline (2024) by 2030.

Aircraft operations are a major source of air pollution for communities surrounding airports, particularly during takeoff, landing, and ground operations. Sustainable Aviation Fuel (SAF) is a lower-carbon alternative to conventional jet fuel that can reduce lifecycle greenhouse gas emissions while working with today's aircraft and fueling systems. This target focuses on accelerating SAF use at Los Angeles World Airports by leveraging airport leadership, airline partnerships, and fuel infrastructure to reduce pollution from flights serving the region.

Progress:

- LAX has become one of the leading airports in the country for SAF adoption, with multiple airlines regularly blending SAF into their fuel supply.
- SAF currently represents a little over 2.5% of total jet fuel use, but LAWA is supporting airline partners and fuel suppliers to expand SAF availability through logistics and policy advocacy.

Convert 100% of the LAWA sedan fleet to zero-emission and expand EV charging to 1,200 stations for employees and passengers by 2035. Deploy transportation demand management strategies to reduce vehicle miles traveled through employee commutes by achieving a 10% participation rate in Transportation Management Organization programming by 2035.

Vehicles operating at LAWA run day and night to move passengers, employees, and equipment, making them a significant source of local air pollution. This target builds on that momentum by completing the transition to a fully zero-emission fleet, expanding charging access for workers and travelers, and ensuring the airport has enough reliable power to support electrification.

Progress:

- LAWA has a comprehensive policy for transitioning its light-duty sedan fleet to EVs, mandating that 25% of its sedan fleet was electric by 2023 and the sedan fleet will reach 100% by December 2031. Currently, 67% of LAWA's sedan fleet is electric.
- LAWA also prioritizes zero-emission options for other light-duty vehicles, choosing them whenever they meet operational requirements.
- LAWA's zero-emission bus policy mandates 100% zero-emissions bus fleet by 2030. Currently, 50% of LAWA's bus fleet is already zero-emission. So far, LAWA has purchased over 30 zero-emission battery-electric airfield buses for its operations. New buses will replace older natural gas and diesel buses, reducing GHG emissions and improving air quality around LAWA's airports. With the Automated People Mover, LAWA expects further to reduce its dependence on buses for passenger movement.

GOAL 2: LA Will Be Home to Climate-Resilient Neighborhoods Where People and Nature Can Thrive

Los Angeles is already experiencing the effects of a changing climate—hotter summers, more frequent wildfires, heavier rainfall, and prolonged droughts that threaten the health, safety, and livability of our neighborhoods. Building resilience requires protecting our infrastructure and ecosystems, and improving health outcomes in our communities so they can thrive in the face of climate change. Communities with cleaner air, access to green spaces, and minimal environmental burdens are more resilient to extreme heat, flooding, wildfire, and other climate hazards.

To address our city's climate threats, we are investing in climate resilience by restoring biodiversity and expanding green spaces to re-establish ecosystems that act as natural buffers, absorb floodwaters, cool urban heat, improve air quality, and create fire-resilient landscapes that protect our communities while supporting long-term public health. Improving the quality of the city's natural systems will reduce exposure to climate hazards and strengthen baseline health conditions, both of which are critical to reducing climate-related health impacts.

Building resilience means addressing overlapping exposures that can magnify climate risks. In Los Angeles, many communities face cumulative pollution burdens from multiple sources, including localized air toxins from industrial operations and pollutants from transit corridors. Reducing these exposures is an important component of achieving community resilience to climate change by reducing cumulative health vulnerabilities that can worsen outcomes during extreme weather events. Part of the City's efforts to keep our communities healthy and clean include working toward closing urban oil fields that spew toxins, remediating the land so that we can have more parks and housing options, and diverting organics from landfills. Through this goal, the City will unite efforts across departments to strengthen ecosystems and green infrastructure; expand access to open space and clean water; and ensure preparedness, equity, and community well-being. By prioritizing neighborhoods most affected by climate and environmental burdens and integrating multi-benefit solutions into our infrastructure, Los Angeles will make its natural systems a foundation for resilience.

Where We Are Now

Los Angeles manages a wide range of programs that advance climate resilience – from infrastructure improvements, urban forest expansion, and green street retrofits to stormwater capture, water recycling and conservation, and emergency preparedness. Yet, many neighborhoods remain highly exposed to heat, flooding, and wildfire risks. Key departments are advancing complementary efforts, from park, land, and watershed restoration to green infrastructure and stormwater upgrades. However, maintenance and funding remain challenges.

Where We Will Be

When this goal is achieved, Los Angeles neighborhoods will enjoy cleaner air, stay cooler during heat waves, be protected from flooding and wildfire, and feature thriving parks, tree canopies, and California native landscapes that improve community health. Streets and public spaces will provide shade, capture and reuse stormwater, and connect residents safely to parks, schools, and daily destinations. Recreation centers and libraries will double as resilience hubs equipped with backup power, cooling, and emergency resources. Restored soils and landscapes will absorb rain, conserve water, reduce erosion, and buffer homes from fire, flooding, and sea-level rise. Every Angeleno will live in a neighborhood prepared for climate impacts, supported by green infrastructure and healthy ecosystems designed for long-term well-being and resilience.

Equity Impacts

Los Angeles is building climate resilience by ensuring all neighborhoods—especially those most vulnerable to climate hazards—have equitable access to reliable water, green infrastructure, and thriving ecosystems. By prioritizing investments where risks are highest and partnering with local communities, the City is transforming the built and natural environment to strengthen long-term preparedness for the populations and communities at the greatest risk of harm.

Key climate equity initiatives include:

- Expanding Green Space: Utilizing the Park Needs Assessment to prioritize tree planting and new parks in underserved areas.
- Community Co-creation: Partnering with impacted stakeholders to envision a just transition for existing oil well sites and impacted workers.
- Direct Support: Offering LADWP programs like free water quality testing and direct-install native, drought-tolerant landscaping for those lacking upfront capital.
- Food Waste to Recovery: Feeding Angelenos by rescuing edible food from large generators and connecting it to community partners.

Who Will Get This Done

The Mayor has an ambitious plan to ensure our infrastructure is resilient, which will require collaboration with multiple city agencies. The Mayor will ensure City departments coordinate to ensure on-time and successful implementation:

- All departments will ensure that we connect green spaces and ecosystems across the City. RAP supports greater park access and equity. The Office of Forest Management (OFM) will lead efforts to expand and maintain the urban forest and tree canopy in Los Angeles' Parks.
- DBS, EMD, and City Planning will examine and assist in reducing risk from extreme heat, wildfire, and flooding. The Los Angeles Fire Department (LAFD) will support wildfire risk reduction efforts.
- Bureau of Street Services (StreetsLA) will prioritize green infrastructure and cooling strategies to provide multi-benefit projects that reduce heat, conserve water, and support local ecosystems.
- CAO will implement climate budgeting to tie climate priorities to department annual budget cycles.
- City Planning will work closely with the Office of Petroleum and Natural Gas Administration and Safety (OPNG) to protect public health from toxic emissions resulting from drilling operations in our urban oil fields.
- LADWP and LA Sanitation and Environment (LASAN) will coordinate on ensuring a sustainable and equitable water and wastewater system, with GSD incorporating these water resilience practices into City buildings and facilities design and operations
- LASAN will lead efforts to eliminate organic waste from landfills and reduce waste generated in Los Angeles, including single-use plastics, while supporting a circular economy.
- The Los Angeles Public Library (LAPL) will integrate climate resilient design into library landscaping and expand opportunities for engagement and education.
- BOE integrates multi-benefit park and open-space components into green street and flood-mitigation projects.

Objective 6:

Enhance and connect green spaces and ecosystems across the city to strengthen neighborhood resilience, restore biodiversity, and promote wellbeing for people and nature.

Los Angeles is one of 36 Global Biodiversity Hotspots, hosting over 4,000 plant and animal species within a massive urban ecosystem. Los Angeles' ecosystems are essential infrastructure for climate resilience. Parks, open spaces, and native landscapes help cool neighborhoods, absorb rain, reduce flood risk, improve soil health, and provide habitat for wildlife—all while supporting community well-being. City departments are advancing complementary initiatives—from tree-planting and vegetation-management programs to habitat restoration, soil-health pilots, and

design standards that promote permeable surfaces and climate-appropriate plants. Los Angeles is also currently examining processes and engagement strategies using Indigenous knowledge to maintain healthy and balanced ecosystems.

Objective 6: Green Spaces & Ecosystems - Targets & Actions

6a

Replace non-functional turf in City and commercial facilities and landscapes with California native or climate-adapted plants by 2027, prioritizing high-water-use sites and disadvantaged communities.

Nonfunctional turf, such as decorative grass in medians and lawns around public buildings, uses large amounts of potable water without providing recreational or environmental benefits. As droughts become longer and more frequent and extreme heat events add stress on water supplies, maintaining these landscapes becomes increasingly unsustainable for our city. Replacing nonfunctional turf with California native or climate-adapted plants helps conserve water and supports healthy soils. This target aligns with state law, which prohibits the use of potable water to irrigate non-functional turf at government and commercial properties.

Progress:

- RAP is conducting native plant restoration by RAP Urban Ecologists, in partnership with nonprofit organizations. In addition to these efforts, RAP installs decomposed granite, mulch, and drought-tolerant and native plants where appropriate.
- StreetsLA is managing three projects in the design phase with the goals of infiltrating stormwater and incorporating low-water native plants to reduce overall water demand.
- StreetsLA is advancing depaving and increasing permeability through tree well installations and conversion of asphalt roadways into landscaped medians, with over 8,000 square feet delivered in Fiscal Year (FY) 24–25 and more than 330,000 square feet completed, in construction, or in design in FY25–26.
- In 2026, LADWP's turf removal incentives are \$7 per square foot for government partners and \$6 per square foot for commercial customers to meet the state policy of removing ornamental turf.
- In 2024, LAPL completed a landscape redesign at the Venice Branch Library, incorporating native, drought-tolerant plants. In 2026, LAPL completed another landscape improvement project at the Robertson Branch Library.

Use at least 50% of locally produced compost and mulch within Los Angeles by 2030 to enhance soil health, support the growth of plants, improve stormwater infiltration, and increase carbon storage.

Healthy soils are the foundation of Los Angeles's green-infrastructure network. Returning locally produced compost and mulch to City landscapes improves water retention, reduces runoff, enriches plant health, and decreases the need for chemical fertilizers and herbicides. Using organic material generated through City recycling and green-waste programs also closes the loop—turning waste into a climate solution that supports plant growth, carbon storage, and resilient, water-efficient landscapes across parks, parkways, and post-fire restoration sites.

Progress:

- Measure W green-infrastructure projects are incorporating compost-amended soils to improve infiltration and drought tolerance.
- As of 2025, LASAN produced roughly 350,000 tons of compost and mulch annually from City green- and food-waste diversion programs; an estimated 25–30% is re-applied locally. The remaining material is exported for agricultural use outside the region.
- The City's Commercial Franchise System and RecycLA Organics Program continue to increase the supply of compostable materials diverted from landfills. At the same time, new community compost hubs help residents participate directly in local soil-building.

Establish five new parks in priority neighborhoods identified by the Park Needs Assessment, by 2030, and 10 by 2035, to provide park access to the top 25% of highest-need residents currently lacking it.

Expanding and improving parks are central to creating healthier, more resilient neighborhoods. Increasing access to open space—especially in park-poor and heat-vulnerable areas—reduces exposure to extreme heat, supports physical and mental health, and strengthens community connections. Upgrading existing parks with native and climate-adapted plants, shaded gathering spaces, and habitat corridors ensures that every new or renovated park contributes to biodiversity, cooling, and social vitality.

Progress:

- Over the past 10 years, RAP has increased park acreage by acquiring over 40 new parks. The Community School Parks program supplements this effort, which currently has 10 sites open.
- As of 2018, 56% of residents live within ½ mile of a park or open space.
- City Planning is updating the Open Space Element and Community Plans to include policies that address park-access equity and priorities for new parks.
- BOE integrates multi-benefit park and open-space components into green street and flood-mitigation projects.

Increase overall tree canopy to cover 25% citywide by 2035, ensuring at least 15% canopy in City neighborhoods, and prioritizing heat-vulnerable communities.

Expanding and distributing tree canopy equitably will reduce heat exposure, improve comfort, and create greener, more livable neighborhoods. A denser, healthier urban forest provides shade, improves air and water quality, and enhances community well-being—especially in areas with the least tree cover and the highest heat risk. The Urban Forest Management Plan will flesh out these metrics and action plans.

Progress:

- The citywide Urban Forest Management Plan is underway and will finalize new canopy-cover baselines and targets by 2026. The baseline data from 2020 show a citywide canopy of 22.8%, with over 40% of neighborhoods below the 15% canopy target.
- OFM is collaborating with research and regional partners to update canopy mapping and identify priority zones below 15% cover for expansion, to be achieved through strategies that include tree preservation and maintenance of existing trees, as well as strategic planting of new trees.
- StreetsLA developed a Tree Planting Prioritization Plan aligned with canopy goals, integrating data from the University of Southern California (USC) and the University of California, Los Angeles (UCLA) to identify high-need planting sites.
- StreetsLA has planted over 10,000 trees, supported nearly 18,000 additional trees through planting partner permits, and conducted over 38,000 tree watering since FY20–21.

Increase the City of LA's Biodiversity Index Score 35% by 2035 from the 2022 baseline.

The Biodiversity Index provides a single citywide score that reflects the diversity of native species, the connectivity and quality of habitats, and the strength of the City's environmental policies. The City received a score of 37 out of 110 in 2022. A higher score not only indicates stronger ecosystems but also signals cleaner water, cooler, greener streets, more pollinators and wildlife in urban spaces, and better access to nature for residents. Together, these benefits improve public health, mental well-being, and community resilience, making biodiversity restoration a direct investment in people.

Progress:

- StreetsLA converted 15 existing medians from high-water turf and shrubs to native, low-water landscapes (90,000 SF) and constructed 5 new medians by removing concrete and asphalt (40,000 SF), planting 99 native trees and over 13,000 native shrubs across disadvantaged communities in six Council Districts.
- In 2025, City Planning developed a Landscape and Site

Ordinance for Council review that promotes California native and climate-adapted plants, biodiversity, and green infrastructure in new non-residential and multi-family projects.

- In 2025, LAPL's month-long LA Nature Quest (formerly LA BioBlitz Challenge) engaged Angelenos via the iNaturalist app, generating 10,000+ biodiversity observations, documenting 27 of 38 indicator species, and filling 6% of cold spots. Library biodiversity programs reached 1,723 attendees, boosting community awareness and participation.
- In 2024, LAPL established a pollinator urban garden at the Echo Park Branch Library. Plans for another urban garden at the Studio City Branch Library are expected for 2026.

Project Highlights

Protecting the El Segundo Blue Butterfly

On the west side of Los Angeles International Airport, the LAX Dunes—a 302-acre coastal habitat preserved and managed by LAWA—hosts one of the last remaining populations of the endangered El Segundo Blue Butterfly. Once nearly extinct, the butterfly's numbers have rebounded thanks to decades of restoration work that removed invasive iceplant, re-established native dune buckwheat, and stabilized eroding dunes. The project demonstrates that even in one of the world's busiest aviation corridors, urban infrastructure can coexist with thriving ecosystems. LAWA has partnered with local conservation corps, volunteers, and local biologists to manage the site, monitor species, and provide public education through community restoration days. The dunes also protect surrounding neighborhoods by absorbing coastal winds and buffering storm surge—proving that biodiversity restoration can deliver both ecological and community resilience benefits.

Objective 7:

Reduce risks from extreme heat, drought, wildfire, and flooding by scaling nature-based solutions, green infrastructure, and community-driven strategies that make neighborhoods safer, healthier, and more resilient.

Achieving climate-resilient neighborhoods with thriving communities and natural ecosystems in Los Angeles requires us to address multiple climate-related risks, including extreme heat, wildfires, flooding, drought, and sea-level rise. The City of Los Angeles is already taking action to reduce risks from extreme heat, wildfire, and flooding. The January 2025 wildfires, driven by hurricane-force Santa Ana winds and severe drought, underscored the need to act urgently. For wildfire risk, mayoral directives and the City's CVA have increased focus on safer rebuilding, defensible space, and fire-resistant construction. Flood-mitigation projects, including green streets, stormwater capture, and permeable surfaces, can reduce flooding in

localized areas of the city. Still, coverage remains uneven, and long-term coordination and maintenance remain challenging. Although these efforts show meaningful progress, protections from heat, wildfire, and flooding still vary by neighborhood.

Objective 7: Reduce Risks From Climate Hazards - Targets & Actions

7a

In 2026, implement fire-resistant construction and site standards in Very High Fire Hazard Severity Zones, and ensure public facilities incorporate resilient, fire-safe design and defensible space.

Wildfires are becoming more frequent and severe, threatening homes, habitat, infrastructure, watershed health, and public facilities across Los Angeles. In areas at highest risk, building design and site conditions play a critical role in determining whether fires spread quickly or remain contained. This target focuses on strengthening construction and site standards in Very High Fire Hazard Severity Zones to reduce ignition risk, protect residents, and limit damage to surrounding communities. By setting clear, fire-resistant standards for new development, rebuilding, and public facilities, the City can reduce long-term risk, support safer recovery, and ensure public investments are designed to withstand future wildfire conditions.

Progress:

- Directives for defensible space, fire-resistant construction, and resilient rebuilding are established under Mayor's Executive Order No. 5 (2025).
- New California fire-resistant code mandates that wildland-urban Interface (WUI) construction and interior furnishings use fire-rated materials and maintain defensible space.
- The design of the new Palisades Branch Library is centered on rebuilding as a permanent, fire-resilient community hub.

7b

Release the Los Angeles Community Wildfire Protection Plan with community input by 2026 and implement recommendations to reduce wildfire risks and protect communities.

As climate risks intensify, Los Angeles must take a comprehensive, strategic approach to reducing wildfire risk and improving neighborhood conditions. A Community Wildfire Protection Plan is a collaboratively developed plan focused on reducing wildfire risk to Angelenos, our natural ecosystems, cultural resources, buildings, and infrastructure. Led by MySafe:LA and working closely with LAFD, this plan commits to a planning process that will guide wildfire mitigation efforts and direct resources into communities where they will have the greatest impact.

Progress:

- The Mayor's Executive Order No. 5 (2025) commits the City to building a safer, more resilient Los Angeles.
- MySafe:LA continues to work with LAFD and communities to prepare and educate communities through the Wildfire Resiliency Alliance.

By 2027, integrate the Climate Vulnerability Assessment to guide City Budgeting, Capital Planning, and community planning to ensure City investments address disproportionate impacts from climate change.

As the CVA highlighted, Los Angeles faces growing climate risks such as extreme heat, flooding, wildfire, and poor air quality, but these impacts are not felt equally across the city. Some neighborhoods face higher exposure due to historic disinvestment, land-use patterns, and limited access to cooling and green spaces. The City has made progress in addressing individual climate hazards, but decisions about where to invest and which projects to move forward are needed to guide consistent criteria for addressing climate vulnerability. This target establishes a shared framework to help ensure City investments are directed first to communities facing the greatest climate risks and barriers to recovery.

Progress:

- In 2024, Los Angeles adopted its most recent Local Hazard Mitigation Plan to reduce vulnerability to disasters and demonstrate the City's commitment to reducing risks from natural hazards.
- In 2023, the CAO created its Climate Impact Team to prioritize climate in the budgeting process, which aims to apply climate-prioritization categories and resilient measures to better inform budget decisions.

Adopt and implement the City's first Heat Action and Resilience Plan by 2027 to reduce exposure, protect residents, and safeguard infrastructure.

With rising temperatures, protecting Angelenos from extreme heat, both outdoors and indoors, is increasingly vital. The City currently employs a variety of initiatives, including expanding shade cover to cool neighborhoods, climate-resilient bus shelters, cool roofs, heat-reducing pavement, and establishing more cooling centers in high-risk areas to minimize exposure on the hottest days. To keep people cool indoors and protect residents at home, the City has a long-standing cool roof policy, and the City Council is considering adopting the County's indoor heat temperature ordinance to create a maximum temperature threshold of 82°F. This new target seeks to formalize and strengthen the City departments' ongoing work by creating a comprehensive Heat Action and Resilience Plan (HARP) and by guiding further investment in heat-resilient and cooling infrastructure to reshape the city into a more liveable, mobile, and cooler city of the future.

Progress:

- EMD is leading efforts on the HARP, having secured a state planning grant to develop the plan. The HARP will align with extreme heat strategies in relevant local plans and the State's Extreme Heat Action Plan.
- During extreme heat events, EMD works with select City Departments and the Mayor's Office of Public Safety to activate dedicated cooling centers, so residents in impacted areas have nearby places to cool off. LADWP helps residents stay cool at home through programs that replace older air conditioners with more energy-efficient models. Upon notice, LAPL activates branch library cooling centers.
- StreetsLA continues its Cool Neighborhoods program (approximately 8,994 lane miles completed in FY22–23), pairing reflective pavement with tree planting in high-heat areas. Approximately 89 lane miles of cool paving were completed in FY22–23, and nearly 200 lane miles have been delivered citywide across dozens of neighborhoods since FY16–17.
- In 2015, the City became the first large city to implement a cool roofs ordinance that requires new construction and roof replacement projects to install cool roofs, while LADWP provides cool roof rebates ranging from \$0.20 to \$0.60 per square foot, depending on product performance. Participation continues to remain strong with over 91,000 reroofing permits issued in 2025.
- The City provides residents with services and information on cooling strategies and resources, including the Cool Spots LA map, Heat Relief 4 LA community campaigns, and Heat Relief outreach materials in multiple formats and 15 languages.

Develop a network of resilience centers that provide residents with shelter, communications, and resources during a climate emergency and prioritize communities most vulnerable to climate change by 2027.

Community facilities, such as recreation centers and libraries, play an important role during heat waves, power outages, and other climate emergencies. As climate impacts become more frequent and affect more communities, we need to understand which facilities can best serve as resilience hubs and identify the necessary upgrades to support residents during extended emergencies. Led by EMD, this target establishes a citywide assessment to evaluate where resilience hubs are most needed, what services and infrastructure are required, and prioritize investments that deliver the greatest benefit. By taking a strategic, data-driven approach, the City can ensure resources are used efficiently and directed to communities facing the highest climate risks.

Progress:

- Los Angeles currently operates approximately 200 cooling and cool spot locations across recreation centers, libraries, and other public facilities.
- LADWP and RAP are constructing solar- and battery-powered systems at the Green Meadows Recreation Center, demonstrating how community facilities can become resilience hubs that provide safe indoor space, power, and services during heat and power disruptions.

Project Highlights

Transforming Alleys into Green Infrastructure

In South Los Angeles, the City's Green Alleys Program shows how nature-based design can turn flood-prone backstreets into assets for both people and the planet. Led by LASAN, the program replaces heat-trapping asphalt with permeable pavement, underground infiltration systems, and native landscaping that capture millions of gallons of stormwater each year. The green alleys reduce localized flooding, improve water quality, and create cooler, safer walking paths that connect residents to schools, transit, and parks. Many of these projects are located in historically disinvested neighborhoods that have experienced chronic flooding and limited access to green space. Beyond engineering, the program represents climate adaptation through equity—delivering cleaner water, greener blocks, and healthier environments where they're needed most.

Objective 8:

Phase out urban oil and gas drilling and clean up sites so land can be safely reused for housing, parks, and community benefit.

The City is advancing zero-carbon goals by eliminating a major source of local greenhouse gas emissions and toxic air pollution while addressing land uses that are fundamentally incompatible with healthy, climate-resilient communities. The hundreds of active oil wells located across the Los Angeles area constitute one of the largest urban oil fields in the country, spanning over 1,000 acres. This oil drilling boom left a challenging legacy of orphan wells that are not plugged to existing standards, as well as the thousands of active oil wells in the midst of dense urban communities. Today, the City has more than 5,000 active, idle, or abandoned oil and gas wells, the largest

concentration of uncapped oil wells in the greater area. In fact, 1.7 million Angelenos live within one mile of an active oil or gas well.

In the coming years, the City's phase-out of oil and gas extraction, along with stringent interim regulations, will have a profound impact on our environment, water quality, and the health and well-being of our communities. Cleaning up and remediating these sites enables safe reuse of land for housing, parks, and community-serving uses that support compact, climate-smart development and reduce vehicle miles traveled.

Former oil field site converted to Unidad Park.

Objective 8: Phase Out Urban Oil And Gas - Targets & Actions

8a

Adopt an Oil and Gas Drilling Ordinance in 2026 that prohibits new oil and gas extraction, and establishes the process to terminate existing oil and gas extraction across the city.

The City has been working to end oil drilling since 2022, when the City Council initially passed an ordinance to ban new drilling and phase out existing wells over 20 years. Although the original ordinance was rescinded due to legal challenges, the City is committed to reinstating these bans and aligning with state law to reach our zero-carbon and environmental justice goals.

Progress:

- The City continues to explore implementation of meaningful, long-term measures to protect the health of fenceline communities, including completion of amortization studies for existing oil wells in 2025.
- The City and County of Los Angeles currently co-lead the Just Transition Task Force to ensure a just transition for workers and communities impacted by the phase-out of oil drilling and extraction activities in the region.
- In 2019, the City released a groundbreaking Oil and Gas Health Report that analyzed existing oil and gas infrastructure and concluded that there were health risks associated with proximity to such operations.

8b

Issue and implement the Department of City Planning's new measures for land remediation and oil well abandonment that address the environmental impacts from oil operations when multi-family housing is built in sensitive areas in 2026.

New Environmental Protection Measures ensure that property owners fully comply with land remediation and oil abandonment standards when five or more residential units are proposed to be built adjacent to oil wells. To ensure land redevelopment benefits those most impacted, it will be critical to engage community members in the process and to couple investments with protections from displacement.

Progress:

- The proposed Oil and Gas Drilling Ordinance includes a site remediation requirement built into the Mitigation Monitoring Program for future well abandonments. This proposal will be applied citywide.

Objective 9:

Ensure sustainable and equitable water systems through conservation, stormwater capture, and recycled water to secure local and reliable supplies, protect ecosystems, and support community resilience.

Over the last 30 years, Los Angeles's water supply mix has rapidly evolved to adapt to significant reductions in Los Angeles Aqueduct deliveries due to environmental reallocations, reductions in available groundwater supply due to contamination, and intensifying hydrologic extremes affecting supplemental imported supplies from the Bay-Delta and the Colorado River. Conservation is also a central part of the City's water supply strategy. This is evident by the fact that despite a population increase of over 1 million people, Los Angeles uses less water than it did in the 1970s. The City will continue to coordinate across City departments and with regional and state partners to prioritize water supply diversification. In the future, Los Angeles will

expand its investments in recycled water and stormwater capture and continue to invest in meeting the State's goals for water use efficiency. The City plans to prioritize water conservation and use efficiency, develop local water sources, and increase access to drinking water to build a more reliable, sustainable, and resilient water supply, while recognizing and balancing future investments with past achievements.

Objective 9: Sustainable And Equitable Water Systems - Targets & Actions

9a

Reduce per capita potable water use from 133 gallons per capita per day by 25% by 2035.

The City has long recognized that water conservation is a core strategy to improve long-term water-use efficiency and water-supply reliability for its customers. As a result, the City has become a national leader in water use efficiency. Water conservation is an important part of maintaining long-term water supply reliability. It is a key component of the City's goals to reduce potable water use per capita by 25% by 2035, tied to a 2014 baseline of 133 gallons per capita per day.

Progress:

- The state set a residential indoor water-use standard of 42 gallons per person per day by 2030, which the City aims to achieve through the expansion of its programs.
- LADWP met the 2025 target of reducing per capita water use by 22.5% early in September 2024.
- From 2020–2025, Los Angeles has saved over half a billion gallons per year on average through LADWP's rebate and free-device programs. That includes over 5.3 million square feet of turf-replacement incentives to help transform traditional grass lawns into sustainable, drought-tolerant landscapes.

Source 70% of Los Angeles' water locally by 2035 and reach total stormwater capture capacity of 150,000 acre-feet per year (AFY) (supporting water for approximately 1.8 million Angelenos) by 2035 to help replenish groundwater and improve water quality.

This target aims to ensure that Los Angeles recognizes the impact of climate change on its imported supplies and the need to continue investing in local water supplies to maintain the City's water reliability. Today, stormwater that is not captured or infiltrated is lost to the ocean. As part of this comprehensive approach, this target also ensures continued progress in its stormwater capture goals to maintain a sustainable local groundwater basin.

Progress:

- In 2014, approximately 40% of LA's water was sourced locally for drinking water, historic conservation/ water use efficiency, outdoor landscapes, existing stormwater capture capacity, industrial needs, and the environment; LADWP is implementing projects to achieve 63% local water by 2028 and working to reach 70% by 2035.
- Three treatment facilities, constructed under the San Fernando Groundwater Basin Remediation Program, will be operational by 2027 and have the combined capacity to treat groundwater and increase the local supply by approximately 104,000 AFY.
- As of 2026, LA has reached 89,086 AFY of stormwater capture capacity through completed projects, with projects reaching 105,000 AFY by 2028 and 120,000 AFY by 2030.

Increase the number of multi-benefit stormwater capture projects from 42 projects in 2018 to 100 by 2035, leveraging Measure W funding and prioritizing disadvantaged communities.

Stormwater runoff from urban areas is a valuable yet underutilized local water resource. In the City of Los Angeles, most runoff is directed into storm drains and ultimately discharged into the ocean. Meanwhile, increased urbanization has led local groundwater aquifers to receive less recharge, even though they could benefit from this runoff. Additionally, pollutants collected through stormwater runoff create challenges for the City in meeting discharge requirements. Measure W, which passed in 2018, provided a significant source of funding for multi-benefit stormwater capture projects that will capture and treat stormwater to increase local water supply, improve water quality, and enhance public health and green spaces.

Progress:

- To date, the City has received over \$500 million in funding through Measure W since its inception to support the costs of stormwater-related projects and activities.
- Measure W had funded several projects, including the MacArthur Lake Stormwater Capture Project and the David M Gonzalez Recreation Center Stormwater Capture Project.
- LADWP has invested over \$150 million in stormwater capture infrastructure and built over 20 projects to recharge groundwater basins. They have forecasted more than 70 new projects over the next 15 years.

Increase recycled water for beneficial reuse from 27% (FY 2017–18 baseline) to 45% by 2040 and complete the PureWater Los Angeles (PWLA) plan in 2026 to improve water reliability and support climate resilience.

The City's water recycling program enhances LADWP's water supply reliability by increasing the supply of recycled water to offset potable demands. LADWP is advancing the use of recycled water across a range of applications, including both non-potable and potable reuse. Recycled water applications have increased in response to growing public acceptance of recycled water as a safe alternative to traditional potable supplies. LADWP is continuing this investment with PWLA, which will convert the Hyperion wastewater facility into one of the largest recycled water facilities in the region.

Progress:

- LADWP and LASAN completed the Pure Water Los Angeles (PWLA) Master Plan and Program Implementation Plan in March 2025 and are developing the Programmatic Environmental Impact Report for PWLA, with the public comment period having concluded in October 2025.
- Los Angeles will recycle 100% of wastewater at three of the City's four reclamation plants by 2035, and PWLA will begin producing potable reuse supplies for its initial phase as early as 2040.
- The City expects to complete construction of the Groundwater Replenishment Project at the Donald C. Tillman Water Reclamation Plant by 2027, which will recycle up to 45 million gallons per day (MGD).
- In 2026, LASAN and LADWP completed the 1.5 MGD advanced water purification pilot at Hyperion, which provides 0.75 MGD of recycled water to LAX and 0.75 MGD to Hyperion.
- 2% of Los Angeles' water supply comes from non-potable recycled water, delivered through the purple pipe system for landscape irrigation and industrial uses.

Reduce municipal water use from the 2013 baseline by 30% by 2035 and maintain or improve reductions thereafter.

The City has been leading by example in water-use efficiency. Water conservation at City-owned facilities is an important part of the City's holistic water conservation strategy. This target will ensure that the City's municipal water use meets and exceeds state water conservation regulations.

Progress:

- Since 2013, there has been over a 21% reduction in water use from City Departments.
- GSD is reducing water use in City-managed buildings. Key measures include installing chemical-free water treatment for cooling towers and completing water-efficient retrofit projects.
- Water conservation measures at RAP projects have led to a nearly 50% reduction in water use at RAP facilities since 2013. Over 1/3 of water used at parks comes from recycled sources, and about 80% of golf course acreage is irrigated using recycled water.

Project Highlights

Los Angeles Groundwater Replenishment Project

LADWP, in partnership with LASAN, is undertaking the Los Angeles Groundwater Replenishment Project to replenish the San Fernando Basin with highly purified recycled water. It is the largest active water project in the state. It includes the construction of an Advanced Water Purification Facility at the Donald C. Tillman Water Reclamation Plant, which will produce and convey purified water to the Hansen Spreading Grounds in the San Fernando Valley. The project will purify treated wastewater to produce up to 40,000 acre-feet per year of drinking water for the city, enough for almost 500,000 customers. This is an important investment in developing a local, drought-resilient, and reliable water supply for a sustainable Los Angeles.

Objective 10:

Advance a zero-waste, circular economy by reducing trash, composting organics, and reusing materials to cut pollution, save resources, and reduce emissions.

The City is shifting toward a circular economy, replacing a disposal system with reuse and repair to reduce waste and foster local jobs. Aligned with state law, the City's expanding organics recycling program removes a major source of methane—a very potent greenhouse gas—from landfills.

These programs can also reduce food waste by redirecting edible food to those facing food insecurity. In addition to these diversion programs, the City is cutting waste at the source by reducing single-use plastics and other material streams.

Objective 10: Zero Waste & Circular Economy - Targets & Actions

10a

Conduct a citywide waste characterization study by 2027; develop a circular economy plan by 2029 to identify and implement additional waste reduction.

Understanding our waste streams helps inform where, as a city, we are successful in reducing and diverting waste, and which materials are harder to reduce, reuse, or recycle. While the City continues to focus on critical waste streams, including organics and plastics, conducting an updated citywide waste characterization will identify additional next steps and opportunities to achieve our zero-waste goals. In committing to a shift from a disposal economy to a circular economy, based on material and resource reuse, the City will develop a circular economy strategy that also lays out a roadmap for local economic opportunities and high-road jobs.

Progress:

- In 2025, LASAN secured a CalRecycle grant to conduct a comprehensive waste characterization study of residential black- and green-bin materials. The study is scheduled for implementation in 2026, with final report completion in 2027. Findings from this effort will help inform a circular economy plan.

10b

Reduce per capita solid waste generation by at least 15% by 2030 from approximately 19.8 pounds per day to 16.8 pounds per person per day, including phasing out of single-use plastics by 2032.

Reducing the average amount of waste generated per person requires a multi-pronged approach, focused on source reduction. Reducing major waste sources—such as plastics, textiles, and construction & demolition materials—is crucial. Single-use plastics, such as straws, plastic utensils, bottles, and takeout containers, have become part of everyday life over the past few decades. Most of this plastic ends up polluting our landfills, oceans, and environment, with less than 10% of plastic waste recycled globally. Plastic waste also contaminates our waterways and can clog stormwater drains. Phasing out plastic waste and decreasing the overall volume of waste generated can reduce environmental plastic pollution.

Progress:

- In 2024, LASAN adopted the Comprehensive Plastics Reduction Program.
- LASAN is conducting plastics-reduction outreach and enforcement and continues to advance the approval and implementation of programs, including extended producer responsibility policies and targeted bans on high-impact categories such as foodware, plastic bottles, and textiles.
- LASAN is also pursuing extended producer responsibility and stewardship programs and technologies to increase recycling and reuse of materials, including household hazardous waste, e-wastes, construction and demolition materials, and textiles.

Eliminate organic waste going to landfills by 2035.

Organic waste typically constitutes 30–40% of total waste and is a primary contributor to methane generation in landfills. To meet zero-waste goals and comply with state law, the City has implemented organic recycling programs for businesses and residents, reducing the amount of organics going to landfills and recovering edible food. To achieve this goal, the City has been and will continue to expand organics collection for customers, conduct outreach and education, and implement food recovery programs. .

Progress:

- Through anaerobic digestion, composting, or donation programs, the City has diverted approximately 20,000–25,000 tons of food waste, equating to over 40 million meals.
- In 2023, LASAN started the Organics Recycling Program, rolling out organics collection for 750,000 residential customers. LASAN will be rolling out organics collection for businesses and apartments as part of RecycLA 2.0 in 2027.
- LASAN is bringing Edible Food Generators into compliance to recover the maximum amount of surplus edible food.

GOAL 3: LA Will Be a Thriving Green Economy with Opportunity for All

Sustainable economic growth is a catalyst for job creation, bolstering energy reliability and attracting regional investment, all while spurring innovation to meet Los Angeles' climate goals. Green growth attracts continuing investment and adds enhanced value across Los Angeles' diverse industries. A green economy is not a stand-alone investment sector; it enhances and expands Los Angeles' current economic sectors, including trade/logistics, technology, manufacturing, and construction.

The City of Los Angeles is also forging a path for green jobs and training to ensure we have skilled workers in clean energy, efficiency, and conservation across sectors such as construction, transportation, and manufacturing. Moreover, as industries and businesses increasingly adopt sustainable practices, this segment is expected to account for a larger share of the city's total employment.

Where We Are Now

Los Angeles has fostered several key partnerships to advance the green economy over the last decade. From the opening of the La Kretz Innovation Campus with LADWP to the establishment of AltaSea at the Port of Los Angeles, Los Angeles demonstrates that it's Open for Business while developing a robust green economy. The City surpassed its Green Job targets that were established in LA's Green New Deal ahead of schedule in 2025. The City continues to partner with non-profits, unions, academic institutions, and private sector companies to increase green job placements and train Angelenos for the new green economy. To increase transparency and accountability, Los Angeles is also developing standards for definitions and performance to track progress. Tracking progress will enable Los Angeles to strategically target investment and prioritize efforts, ensuring equitable benefits from the growth of green jobs.

Where We Will Be

Prioritizing a green and sustainable local economy will yield significant, interconnected social and economic advantages for Los Angeles. The City's efforts will provide sustainable and inclusive growth while simultaneously mitigating environmental risks and bolstering ecological resources. Green investments and business expansion are key to enhancing and creating quality jobs. These investments will also lead to cost savings in energy-efficient infrastructure, reduce operational costs, and lower utility bills for individuals and businesses. Crucially, green investments offer a dual benefit: strengthening company portfolios and improving our communities' quality of life, thereby increasing market values.

Equity Impacts

A just green economy will strategically distribute investments to ensure a more equitable distribution of benefits, prioritizing areas that have historically suffered from environmental injustices and are currently burdened by regional and industrial pollution. Communities most impacted by pollution and climate change have historically faced barriers to stable employment and workforce training. This objective prioritizes expanding access to green careers for underrepresented populations through targeted hiring, paid training, apprenticeships, and supportive services.

Key climate equity initiatives include:

- **Prioritizing Equity:** The City is focusing climate investments on disadvantaged communities, combining environmental benefits with economic opportunities.
- **Workforce Development:** Through Project Labor Agreements (PLAs), local hire programs, and equity-focused workforce initiatives, the City is creating job opportunities for underrepresented residents.
- **Economic Empowerment:** The City is partnering with its entrepreneurial incubators to ensure that the funding they receive encourages local hiring and reinvestment back into Los Angeles communities.

Who Will Get This Done

The Mayor will ensure City departments develop a truly inclusive green economy for all:

- The Personnel Department will ensure workers are placed and have the skill sets for the green economy.
- The Los Angeles Economic and Workforce Development Department (EWDD) and the Bureau of Contract Administration (BCA) will work to plan and track green job growth.
- LADWP will develop pipeline jobs and partner with Unions and the private sector to ensure we have a skilled, abundant workforce.
- LAPL will connect science-based educational resources and programming to connect Angelenos to growing fields.
- LASAN will work on green business certifications.
- LADWP will work with Community Development Financial Institutions (CDFIs) to encourage rebate stacking and to help building owners secure sufficient upfront funding for building decarbonization and efficiency upgrades.
- The Mayor's Office will continue to collaborate with non-profits, unions, and private sector organizations.

Objective 11:

Create high-road green jobs and expand access to training and apprenticeships that provide stable careers, family-sustaining wages, and pathways into the green economy for Angelenos as we move toward a climate-resilient future.

When this objective is achieved, Los Angeles will have a coordinated green workforce system that connects residents to high-quality jobs created through the City's climate investments. Training and hiring pipelines will align more closely with demand in clean energy, zero-emission transportation, climate resilience, and land stewardship. City-funded projects will continue to serve as a major

source of job creation, with partnerships with unions, employers, and community organizations. While these efforts are producing results, they require coordination and a workforce strategy tied to long-term climate implementation.

Objective 11: Green Economy - Targets & Actions

11a

In 2026, launch a workforce development pilot program to train workers for high-road jobs focused on land restoration and climate adaptation techniques to conduct vegetation management in the Wildland-Urban Interface (WUI) around high fire risk zones.

Nature-based solution jobs are on the rise as public and private organizations invest in meeting net-zero, biodiversity, and sustainability targets. These roles focus on restoring ecosystems to address climate change, biodiversity loss, or disaster risk—while providing human well-being and biodiversity benefits. As we continue to learn and research the benefits of using nature to protect and enhance both our open and urban spaces, this economic space will continue to increase.

Progress:

- The Board of Public Works has several key workforce opportunities, including Clean Jobs LA, Community Composting and Food Waste Recovery, and River Rangers.
- The LAPL Neighborhood Science program grows interest and skill sets in this field of nature.
- The LA Conservation Corps, partnering with City Plants, LADWP, and the Board of Public Works, trains youth on tree planting and promotes urban greening opportunities.

11b

Adopt and implement departmental green workforce plans across the City by 2028 to align recruitment, hiring, and upskilling with the City's Climate Goals, prioritizing graduates of the City's green pathway programs, recently arrived immigrants, first-generation college students, people experiencing homelessness, justice-impacted communities, and other underrepresented populations.

City Departments are developing an array of green job plans. The current initiatives include EWDD's development of strategic pathways for tracking green job growth, alongside LADWP's analysis of the green job development required to support the region's increased electrification goals. Contributing to these goals is the Blue & Green Sector Coalition, specifically projected to place 2,500 Angelenos in the City of Los Angeles' Workforce Development Board (WDB)'s 5-Year Workforce Development Strategic Plan. These plans will use data to monitor and address disparities, ensuring every Angeleno, particularly those experiencing economic hardship, can access green job opportunities.

Progress:

- WDB's Five-Year Strategic Plan has set the central objective to connect 50,000 residents with high-quality, living-wage jobs, registered apprenticeships, paid work experiences, and training by the year 2030.
- LADWP, as part of its LA100 Equity Strategies, released in 2023, conducted a required growth and job analysis to place green jobs.
- The City is an active participant in the Los Angeles Cleantech Incubator (LACI)'s Green Jobs Regional Partnership, a cross-sector effort established to coordinate regional growth in the green jobs sector, with a specific focus on transportation electrification.

11c

Train over 400 people annually in the City's career pathway programs in green sectors, prioritizing equity-focused training and apprenticeships.

The City currently offers several programs across various departments that cultivate career pathways and have the potential to bolster green jobs and/or skills. Ensuring that workers have the necessary experience and skills to compete for and participate in green projects is vital to the growth of the green economy. Skilled workers drive innovation in renewable energy and efficiency, ensuring we have the technical needs for sustainability goals, reducing emissions, and maintaining Los Angeles' economic competitiveness.

Progress:

- EWDD manages Hire LA's Youth Programs, High Roads Training Partnerships, Registered Apprenticeship Programs, and the Green Jobs Policy in the Workforce Delivery System.
- The LADWP Utility Pre-Craft Trainee Program and the utility worker program have trained 611 workers since 2011.

Increase green jobs to 165,000 by 2028, 220,000 by 2030, and 320,000 by 2035 through City programs, from a baseline of 118,000 in 2026.

The City of Los Angeles is a major driver of employment not only through its workforce but also through its construction and contracting. The City encourages high-road job development through its contracts by promoting training and local hiring. In addition, the City encourages PLAs that ensure local residents have access to jobs and gain the skills for job growth. This metric tracks the City of Los Angeles hiring through its contracting services to support green job growth. Los Angeles has significantly grown its green economy and remains a major contributor to the region's job growth.

Progress:

- As of January 2026, the City has successfully exceeded its target set in 2013 of creating 100,000 green jobs by 16%.
- The City of Los Angeles utilizes Project Labor Agreements (PLAs) to provide a significant boost to local jobs. Between 2020 and 2030, the City of LA estimates employing over 2,800 local workers on over 50 PLA projects.
- Construction of PWLA facilities and groundwater projects between 2030 and 2056 will generate demand for local skilled-trades employment under PLAs, supporting an estimated 150,000 green jobs.

Project Highlights

San Fernando Groundwater Basin Remediation Program Project Labor Agreement

The San Fernando Groundwater Basin Remediation Program PLA is a collaborative labor contract between LADWP, the Contractor, and the Los Angeles/Orange County Building Trades Unions. This agreement helps reinvest wages into local communities by requiring that City residents perform a portion of the work. It supports the recruitment, retention, and graduation of local apprentices, creating pathways for long-term careers in the skilled trades. LADWP is using the PLA to construct two groundwater treatment facilities, the North Hollywood Central and the Tujunga Groundwater Remediation

facilities. Once completed, these facilities will clean up local groundwater by reducing exposure to contaminants and helping to secure a reliable water supply for the future. Through the PLA, the project's contractor surpassed local hiring goals, delivering significant community benefits. Los Angeles residents worked nearly 350,000 hours (37% of the project, surpassing the 30% goal), transitional workers accounted for over 105,000 hours (11% vs. 10% goal), and apprentices performed over 85,000 hours (51% vs. 50% goal).

Objective 12:

Grow Los Angeles' green business sector by encouraging private investment, sustainable practices, and entrepreneurship that keep wealth and opportunity in our communities.

Los Angeles is committed to fostering a robust and diverse green economy. Achieving our climate objectives requires deep collaboration with the private sector and businesses to develop innovative, sustainable practices. To do this, we need to unlock capital funding for green infrastructure and work on private-public partnerships models. Los Angeles has developed private-public partnerships to drive innovation and align green capital goals with the City of Los Angeles. Los Angeles has also developed a Green Business Certification program for small businesses, promoting

local businesses as environmental leaders. Access to this capital will allow customers to receive rebates and discounts, which are normally paid out after the installation. In addition, businesses—both large and small—will integrate sustainability practices, allowing them to save money, reduce emissions, and become more resilient to climate threats. Lastly, the city will develop and maintain effective private-public partnerships that encourage innovation and promote social entrepreneurship to meet local climate goals.

Objective 12: Green Businesses - Targets & Actions

12a

In 2026, launch program to provide upfront capital for building retrofits and other green infrastructure investments to increase the number of green infrastructure projects in the City.

For companies and residents to build green infrastructure, upfront financing is often required. Installing solar and an energy-efficient heating/cooling system will provide significant savings over time, but many companies and individuals don't have the liquidity or capital to make these upgrades. This is where accessible green financing will help ensure operational efficiency and savings while also meeting the City's climate goal. Moreover, working with CDFIs will ensure that local community financial institutions also benefit from these investments.

Progress:

- LADWP is currently developing programs to pair its CAMR rebates with upfront capital opportunities.
- Los Angeles continues to explore options with CDFIs designed to keep public funds in the community, funding affordable housing, sustainable infrastructure, and economic justice projects.

12b

Integrate the City's Climate Budget process to align with City climate goals and GHG reporting and reduction strategies starting in Fiscal Year 26–27.

The Climate Budget embeds the City's environmental goals directly into the citywide budgeting process, aligning how we spend our resources with our climate goals. By shifting from a traditional budget to a climate-integrated model, Los Angeles is institutionalizing accountability across all departments to accelerate our transition to a zero-emission, climate-safe future. The City will apply an analytical, data-driven lens by incorporating Los Angeles GHG reports into funding decisions. This approach ensures that our financial strategies are measurable, transparent, and prioritized to deliver the greatest environmental and community impact.

Progress:

- During the 2024–25 FY, the City participated in the first budgeting process to examine funding priorities.
- Los Angeles continues to manage its GHG inventory to benchmark progress on reducing GHG emissions. The City posts its GHG emissions on an international reporting platform through the Climate Disclosure Project and, in 2025, remains a top-performing city with an A grade.

12c

Increase Green Business Certifications from 280 businesses in 2024 to 1,000 by 2028.

Through LASAN, the City of Los Angeles offers a public-private partnership that provides a green business certification as part of the California Green Business Network. This program recognizes and encourages businesses that operate sustainably by reducing waste, conserving energy and water, and preventing pollution. Los Angeles has developed other public-private partnerships, including those between LACI and LADWP and between POLA and AltaSea. These partnerships are now national models for economic development and provide opportunities for startups and small businesses to develop in Los Angeles.

Progress:

- In 2025, LASAN launched a new online green business directory to connect businesses, consumers, and residents with certified Los Angeles Green Businesses. To date, the City has close to 350 certified green businesses.
- The City is exploring program enhancements to bring tangible benefits to participants and increase participation in the Green Business Program, including by better integrating green businesses in the City's procurement processes.

GOAL 4: LA Will Be a Global Model for Bold and Equitable Climate Leadership

Los Angeles will be a global model for bold and equitable climate leadership by demonstrating that ambitious climate action can and must deliver tangible benefits to communities most impacted by climate change. By pairing aggressive emissions reductions with policies that center equity, public health, and community-led solutions, LA shows how large, diverse cities confront the climate crisis while addressing historic injustices. Leading with innovation, accountability, and inclusive governance, Los Angeles sets a precedent for transforming fossil fuel-dependent systems, investing in frontline communities, and scaling solutions that other cities worldwide can adapt to advance a just, zero-carbon future.

Hosting major sports events creates a once-in-a-generation opportunity to accelerate these commitments with long-term climate investments that extend well beyond the closing ceremonies. By embedding strong climate and equity requirements into the execution of major events, Los Angeles can drive market transformation, create high-quality local jobs, and deliver lasting improvements in air quality, mobility, and public space for local communities. Centering community solutions and partnerships in this work ensures that the benefits of hosting global events are shared equitably, particularly with neighborhoods that have historically borne the costs of pollution and disinvestment. In doing so, Los Angeles demonstrates to the world how cities can use global stages to catalyze durable, inclusive climate action.

Where We Are Now

Building on previous sustainability plans and climate assessments, Los Angeles has established a strong foundation for ambitious and equitable climate leadership as it works toward becoming a zero-carbon city. Los Angeles is a member of several international organizations leading climate initiatives, including C40 Cities, the Kunming-Montreal Global Biodiversity Framework, the Milan Urban Food Policy Pact, and Urban20, to name a few. As preparations advance for hosting major global sporting events, Los Angeles is increasingly aligning its clean energy, zero-transportation, and public health investments with these milestones, signaling the City's intent to lead in this space.

Where We Will Be

In the years leading up to the 2028 Games, Los Angeles will host six major events, including this year's 2026 FIFA World Cup. After this era ends, Los Angeles will be recognized globally as a city that can uphold its ambitious climate commitments while welcoming the world to celebrate athletic achievements. Major events will showcase zero-carbon transportation, renewable energy, sustainable infrastructure, and public health practices, implemented in ways that directly benefit our communities and as inspiration for others. Residents will enjoy improved air quality, accessible parks, and resilient public spaces, while the city's leadership on climate and equity will serve as a replicable model for cities worldwide. By turning global attention into lasting local impact, Los Angeles will demonstrate that bold climate leadership can be both highly visible and deeply transformative.

Equity Impacts

Hosting major sports and international events has the potential to catalyze these investments with a focus on improving the livelihoods of our local neighborhoods. By prioritizing frontline neighborhoods in climate and infrastructure investments, the City ensures that benefits such as cleaner air, safer public spaces, affordable housing, and resilient transportation are shared equitably. Community benefits created through hosting mega sports events will lead to cleaner, shadier, and more transit-rich communities.

Key climate equity initiatives include:

- **Frontline Focus:** Sustainability investments for major sports events—including clean energy, efficient water systems, low-emissions transportation, and heat mitigation—will be designed to directly benefit air quality, health, and climate resilience for our frontline communities.
- **Lasting Legacy:** Residents will also benefit from the economic opportunities these events create, fostering a legacy of healthier, more resilient communities.

Who Will Get This Done

The Mayor will ensure City departments embed climate and equity into major events, leaving a lasting legacy for Los Angeles:

- LADWP hosts the Games Energy Council and ensures the games lead in clean energy and water conservation.
- LADOT will focus on enhancing public access and mobility options.
- LASAN will deliver on reuse and recycling efforts.
- StreetsLA will ensure that streets offer shaded areas for walking and mobility.
- RAP will host viewing parties, offer recreation activities, and assist in hosting Olympic & Paralympic events.

Objective 13:

Make the 2028 Games and other major events models of sustainability through ambitious goals for clean energy, water, transportation, waste, and heat protection to leave a lasting legacy of cleaner air, greener infrastructure, and healthier communities.

By successfully integrating ambitious sustainability goals into the execution of the 2028 Olympic and Paralympic Games and other major events, Los Angeles will set a new global standard for mega-event hosting. Los Angeles will leverage existing clean energy infrastructure and protect the city's natural resources. The Games will capitalize on Los Angeles's existing environmental leadership and are committed to considerably lowering the Games' embodied

carbon by not building new venues. By setting rigorous goals in clean energy, water efficiency, low-emission transportation, zero-waste operations, and heat-protective measures, these events will demonstrate how large-scale gatherings can be both environmentally responsible and equitable.

Objective 13: Major Events - Targets & Actions

13a

Through the Games Energy Council, maximize clean energy for Los Angeles Olympic & Paralympic Games venues by 2028.

The Games Energy Council, led by LADWP, is tasked with ensuring a clean energy-fueled Games in partnership with regional power stakeholders. Established as a requirement of the Games Agreement, it focuses on planning, procurement, and implementation of power solutions, including backup systems and electric mobility, to support a greener Games. This work is in addition to LA28's commitment to 100% renewable purchased electricity for LA28 venues.

Progress:

- The Games Energy Council is coordinating regional energy planning, project/upgrade implementation, risk mitigation, and operations for the 2028 Games.
- LADWP began hosting the Games Energy Council in 2024 to ensure the Games have reliable and clean power.
- Through LACI's public-private Transportation Electrification and Clean Energy Partnership and the overarching Road to 2028 initiative, the City, LADWP, and other partners will work to reduce GHG emissions by 25% by the 2028 Olympic Games through accelerated EV adoption, building electrification, and grid resiliency.

13b

Ensure 100% of concession containers and foodware are reusable, recyclable, or compostable for the 2028 Olympic & Paralympic community events to advance Los Angeles' commitment to phase out single-use plastics.

Major sports events will generate millions of meals and beverages, and without intervention, an enormous volume of single-use plastic waste. Ensuring concession containers and foodware are reusable, recyclable, or compostable dramatically reduces landfill waste, prevents plastic pollution in local communities and waterways, and lowers greenhouse gas emissions associated with producing and disposing of single-use materials.

Progress:

- The City is working with regional partners, including LA28, to ensure that vendor guidelines align with waste-minimization and plastic-reduction strategies.
- For community events hosted by the City or at City facilities, the event organizers will provide reusable, recyclable, or compostable foodware and/or to-go containers to reduce waste.

13c

Reduce food waste at 2028 Olympic & Paralympic community events through edible food recovery, and expand composting and recycling access.

Reducing food waste at major sports events is important because of the enormous quantities of food generated, much of which would otherwise be discarded despite being safe and edible. Recovering surplus food for donation helps address food insecurity across Los Angeles by redirecting nutritious meals to community organizations and residents in need, ensuring that excess food benefits people rather than landfills. Expanding access to composting and recycling further minimizes the environmental impact of unavoidable food waste. Food waste in landfills is a major source of methane, a potent greenhouse gas. By prioritizing composting and proper recycling at City facilities, Los Angeles can significantly reduce emissions, conserve resources, and support its broader climate and zero-waste goals.

Progress:

- LASAN will target the expansion of organic waste collection, including food scraps, for residents and businesses.
- LASAN is conducting outreach and public education on food recovery to repurpose unused food.

Host a Transit-First Games in 2028 by deploying zero-emission buses, expanding micro-mobility access, and enhancing active transportation routes to connect venues and events throughout the City—ensuring legacy transit upgrades in underserved neighborhoods.

The “transit-first” 2028 Games will ensure public transit to game venues and support a large expansion of bus services, dedicated bus lanes, and investments to boost capacity. Key strategies include doubling the Metro fleet by borrowing thousands of additional buses, to connect venues via the Games Enhanced Transit System and enhancing existing bus and rail systems.

Progress:

- Metro will run approximately 1,700 extra buses to ensure the largest number of spectators can move to venues without a private car.
- LADOT to deploy mobility hubs near venues by 2028 to connect people to transit. Mobility hubs locations include Downtown Los Angeles and Hollywood.
- LADOT to implement active transportation connections to the 2028 games sites, focusing on street safety and connecting existing active transportation facilities to the venues and other tourist destinations throughout the City. New protected bike lanes and bus priority lanes will connect to Downtown Venues, Dodger Stadium, Exposition Park, and the UCLA Athletics Village.

Project Highlights

Figueroa Blvd Open Street

LADOT has received approximately \$1.5M from Metro’s Open and Slow Streets Program and funding from the federal Safe Streets for All program to create a temporary open street along Figueroa Boulevard between Downtown Los Angeles and USC/ Expo Park during the Summer 2028 games. During the Games, the City of LA will install traffic barriers and temporary materials to convert this important venue connector into an open street, expanding the pedestrian realm and facilitating safe and comfortable first- and last-mile connections to venues. This open street will connect Summer 2028 venues such as LA Live, Crypto.com Arena, Galen Center, Coliseum, and more to key Metro rail stations, including 7th/Metro Center, Pico, LATTC/Ortho, and Jefferson/USC. This and other open street activations planned for Summer 2028 will create spaces for people to re-envision streets as places for movement and fun.

Objective 14:

Create a lasting climate legacy from mega-events by embedding sustainability, equity, and resilience practices into City policies, programs, and partnerships—ensuring that Los Angeles’ role as host strengthens long-term climate leadership, community benefits, and global influence.

Hosting major global sports events offers Los Angeles a generational chance to accelerate long-term climate investments and drive profound, durable, and inclusive climate action.

The City is laying the groundwork to create a lasting climate legacy from upcoming mega-events, with early efforts focused on integrating sustainability, equity, and

resilience into event planning and city operations. Policies and programs are being developed in partnerships with educational institutions, community organizations, private businesses, and regional agencies to ensure that benefits reach frontline communities.

Objective 14: Climate Legacy - Targets & Actions

14a

Integrate shade structures, new shade trees, hydration stations, misting fans, and other functional cooling strategies around Olympic & Paralympic venues and community events by 2028 to protect the health and safety of workers, volunteers, participants, and spectators from extreme heat.

The City is experiencing extreme weather, such as intensifying storms, wildfires, and heat waves, more frequently than ever before. Given the timing of major sports events during the hottest period of the year, the City will ensure that heat protection measures implemented for these events become a lasting legacy benefiting heat-sensitive populations.

Progress:

- The City has partnered with ShadeLA, a new regional shade campaign launched by USC and UCLA, that will provide shade coverings for the games and plant trees for a lasting legacy.
- LADWP has initiated a first-ever Games Water Council to ensure regional water planning and coordination, including maximizing hydration stations, specifically targeting 2028 sports and non-sports venues.
- The City, along with local partners, participates in a heat working group to ensure that Los Angeles has dedicated cooling strategies beyond the Games.
- StreetsLA's Sidewalk and Transit Amenities Program is replacing or installing 3,000 bus shelters and 450 shade structures, prioritizing heat and transit equity. Over 125 shelters are expected by year's end.

14b

Expand the existing City facilities zero waste ordinance for the 2028 Olympic & Paralympic Games to include all City-sponsored events.

The City is a large consumer of goods and a producer of waste, including food and beverages, as well as related foodware and accessories. The existing zero-waste ordinance eliminates the use of single-use plastics by banning Expanded Polystyrene Foodware products and Single-use or Disposable containers at City facilities or events on City Property, to advance the City's goal of phasing out single-use plastics by 2028. In preparation for the 2028 Games, the City has the opportunity to extend the existing zero-waste ordinance to encompass City-funded events outside of City property, amplifying its impact and advancing sustainability beyond City grounds. This policy initiative will ensure that the use of public funds contributes to the City's sustainability goals.

Progress:

- In 2022, the City of Los Angeles passed a Zero Waste for City Facilities and Events on City Property Ordinance (No. 187718). This ordinance eliminated single-use plastics and banned expanded polystyrene (styrofoam) foodware products at City facilities.
- LADWP is advancing efforts to install hydration stations at 2028 venues that will minimize the need for single-use plastic containers.

Next Steps

Los Angeles is working hard to implement its climate goals. We are well on the way to meeting our goals with tangible projects and programs that make a difference in the lives of Angelenos. The climate crisis requires urgent and committed action, and Los Angeles is delivering. Moreover, we must ensure that implementation centers equity by prioritizing those who are most vulnerable to climate change and providing access to a growing green economy and community-benefiting infrastructure investments.

The Mayor created the Climate Cabinet with the leading City departments to collectively assess our progress and determine the path forward for citywide climate action and implementation. The Mayor's Climate Cabinet will continue to meet to discuss this work, ensure that this framework is implemented, tracked, and on schedule, and hold departments accountable and transparent in their execution of this plan.

Most importantly, we need to ensure that we have authentic community engagement that involves consistent input and feedback. We need to ensure that every Angeleno benefits from these efforts and that we measure progress in our implemented actions. To this end, we will continue to develop partnerships and lock arms with residents, non-profits, researchers, and the private sector in our commitment to a greener Los Angeles. To ensure this plan continues to drive action, we will continue the following:

- Regularly convene the Climate Cabinet and committees with City departments to track progress and implement actions and projects. Consistently convene City departments and their Chief Sustainability Officers.
- Establish a Climate Action Advisory Committee with representation from environmental, community, and labor leaders. The Taskforce will enable coordination to drive successful climate action implementation across sectors, and through collaboration, partnership, and shared expertise.
- Regularly meet with non-profits, neighborhood councils, community leaders, and academic researchers to gather input and follow up on goals and priorities. Ensure that City departments engage with residents in future planning efforts, such as the Forest Management Plan and the Heat Action and Resilience Plan.
- Publicly report progress and status on climate goals through annual updates. Track and manage these updates to align with the City's GHG Inventory reports and efforts to address climate vulnerability.
- Work with departments to prioritize climate priorities through the City's climate budgeting, capital planning, and community planning efforts. Align the CAO CAAP process with this plan to ensure GHG emissions and climate resilience budget goals are prioritized.
- Work with national and international climate communities to update goals and actions in light of new climate realities and share best practices with cities worldwide.

Los Angeles is committed to urgent climate action with accountability and transparency. Focused on implementation, we have prioritized targets over the next ten years where the City can have the greatest impact. We are making sure that hosting major events and investing in green industries create lasting positive benefits and a climate legacy for Angelenos. The success of these measures will require collective action and participation across Los Angeles' communities and sectors. Ultimately, this framework shifts the focus from planning to action. It's not a plan meant to live on a shelf. Rather, it is a live roadmap that we will continue to assess and refine to ensure City investments accelerate climate action and create benefits Angelenos can see every day.

Appendix A

Goals, Objectives, and Targets, and Supporting Departments

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
Goal 1: LA Will Be a Clean, Connected, and Healthy City that Improves Quality of Life for All Angelenos	Objective 1: Deliver clean, affordable energy to every Angeleno by expanding renewable energy, rooftop solar, community solar, and battery storage to lower utility bills, improve reliability, and cut emissions.	A	Increase renewable energy from 30% (2017 baseline) to 80% by 2030 and 100% clean energy by 2035.	LADWP	
		B	Double local solar from the 2024 baseline to 1,504 megawatts by 2030 while prioritizing disadvantaged communities and advancing distributed energy resources.	LADWP	
		C	Expand demand response to 340 megawatts by 2031 (a 400% increase from current capacity) and add 300 megawatt-hours of local energy storage capacity by 2035 to improve grid reliability.	LADWP	
	Objective 2: Make buildings carbon-free by improving efficiency, electrifying homes, and setting strong performance standards to cut energy costs, improve indoor air quality, and reduce pollution.	A	Work with City Council to develop and adopt new policies to achieve net-zero carbon for new buildings and reduce the carbon footprint of existing buildings by 2026.	DBS	LADWP
		B	Increase energy efficiency by 15% from a 2020 baseline by 2030.	LADWP	DBS
		C	Reduce the average carbon intensity of the materials used in new building construction by 40% by 2035.	DBS	BOE
					BSL
					BSS
					GSD
		D	Reduce municipal building greenhouse gas emissions and energy use to support achievement of the City's Carbon Neutrality goal to be net zero by 2035.	BOE	LADWP
	Objective 3: Accelerate the shift to a zero-emissions, connected, and equitable transportation system so getting around is cleaner, cheaper, and healthier for all Angelenos.	A	Electrify 100% of Los Angeles Department of Transportation transit buses by 2028, and coordinate with Metro to accelerate its full bus electrification timeline.	DOT	LADWP
		B	Transition light-duty City-owned fleet vehicles to zero emission by 2030 and convert feasible medium/heavy-duty City-owned fleet vehicles to zero emission by 2030.	GSD	LADWP
					POLA
					LAFD
					LAFD

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
		C	Install 120,000 public and multifamily charging ports by 2030, and ensure the Bureau of Street Lighting installs 10,000 of these chargers in disadvantaged communities.	BSL	BOE
				LADWP	DBS
					DOT
		D	Increase the number of used electric vehicle rebates delivered in disadvantaged communities from approximately 6,000 (2026 baseline) to 10,000 by 2030.	LADWP	
	Objective 4: Reduce transportation-related emissions by promoting walkable neighborhoods and alternate forms of transportation to reduce car trips.	A	Reduce vehicle miles traveled per capita by 5% below the regional average from the 2023 baseline by 2035.	DOT	BSS
					DCP
		B	Increase the number of people walking, biking, using micromobility, matched rides, or public transit for their commutes to at least 24% by 2035, prioritizing investments in disadvantaged communities.	DOT	BSS
					DCP
	Objective 5: Cut pollution from goods movement and major transportation hubs to protect the health of communities near ports, airports, and freeways.	A	In 2026, execute and track the Port of Los Angeles Clean Air Action Plan (CAAP) with additional quantifiable measures (CAAP-Plus) to reduce port-related greenhouse gas emissions 40% below 1990 levels by 2030.	POLA	
		B	Allocate \$200 million on zero-emission truck and infrastructure incentives by 2028 to ensure the Port of Los Angeles will achieve 100% zero-emission drayage trucks by 2035.	POLA	LADWP
		C	Ensure the timely delivery of the Zero Emissions Port Electrification and Operations project, adding at least 200 megawatts of power to the Port marine terminals to ensure the Port can transition all terminal equipment to Zero Emission by 2030.	POLA	LADWP
		D	Continue implementation of the Ports of Los Angeles and Long Beach - Singapore and Shanghai Green Shipping Corridors to assist transition of energy used by ships to zero or near-zero GHG technologies, with deployment of low-carbon ships to the Port by 2030.	POLA	
		E	Partner with airlines, fuel suppliers, and end-users to increase Sustainable Aviation Fuel use at LAX and Van Nuys Airport, targeting a 28% increase from a 40-million gallon baseline (2024) by 2030.	LAWA	
		F	Convert 100% of the Los Angeles World Airports sedan fleet to zero-emission and expand electric vehicle charging to 1,200 stations for employees and passengers by 2035. Deploy transportation demand management strategies to reduce vehicle miles traveled through employee commutes by achieving a 10% participation rate in Transportation Management Organization programming by 2035.	LAWA	LADWP

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
Goal 2: LA Will Be Home to Climate-Resilient Neighborhoods Where People and Nature Can Thrive	Objective 6: Enhance and connect green spaces and ecosystems across the city to strengthen neighborhood resilience, restore biodiversity, and promote wellbeing for people and nature.	A	Replace non-functional turf in City and commercial facilities and landscapes with California native or climate-adapted plants by 2027, prioritizing high-water-use sites and disadvantaged communities.	BSS	LASAN
				GSD	LAWA
				LADWP	
				RAP	
				LAPL	
		B	Use at least 50% of locally produced compost and mulch within Los Angeles by 2030 to enhance soil health, support the growth of plants, improve stormwater infiltration, and increase carbon storage.	LASAN	BOE
					BSS
					GSD
					LADWP
					RAP
		C	Establish five new parks in priority neighborhoods identified by the Park Needs Assessment, by 2030, and 10 by 2035, to provide park access to the top 25% of highest-need residents currently lacking it.	RAP	BOE
					BSS
					DCP
					GSD
					LADWP
					LASAN
		D	Increase overall tree canopy cover to 25% citywide by 2035; ensure a minimum 15% canopy in all neighborhoods and prioritize increasing canopy in heat-vulnerable neighborhoods.	DCP	BSS
					LADWP
					LASAN
					RAP
		E	Increase the City of Los Angeles' Biodiversity Index Score 35% by 2035 from the 2022 baseline.	LASAN	ALL DEPARTMENTS
				LADWP	
	Objective 7: Reduce risks from extreme heat, drought, wildfire, and flooding by scaling nature-based solutions, green infrastructure, and community-driven strategies that make neighborhoods safer, healthier, and more resilient.	A	In 2026, implement fire-resistant construction and site standards in Very High Fire Hazard Severity Zones, and ensure public facilities incorporate resilient, fire-safe design and defensible space.	DBS	BOE
					BPW
					DOT
					LADWP
				DCP	RAP
					LAFD
					LAPL
		B	Release the Los Angeles Community Wildfire Protection Plan with community input by 2026 and implement recommendations to reduce wildfire risks and protect communities.	BOE	BSS
					DCP
					LADWP
				LASAN	RAP
					LAFD
					LAPL

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
		C	By 2027, integrate the Climate Vulnerability Assessment to guide City Budgeting, Capital Planning, and community planning to ensure City investments address disproportionate impacts from climate change.	CAO	
		D	Adopt and implement the City's first Heat Action and Resilience Plan by 2027 to reduce exposure, protect residents, and safeguard infrastructure.	EMD	BOE
					BSL
					BSS
					DBS
					DCP
					DOT
					GSD
					LADWP
					LASAN
					LAWA
					RAP
					LAPL
		E	Develop a network of resilience centers that provide residents with shelter, communications, and resources during a climate emergency and prioritize communities most vulnerable to climate change by 2027.	EMD	DCP
					DOT
					LADWP
					LASAN
					RAP
					LAPL
	Objective 8: Phase out urban oil and gas drilling and clean up sites so land can be safely reused for housing, parks, and community benefit.	A	Adopt an Oil and Gas Drilling Ordinance that rapidly decommissions oil and gas extraction across the City in 2026.	DCP	OPNG
		B	Issue and implement the Department of City Planning's new measures for land remediation and oil well abandonment that address the environmental impacts from oil operations when multi-family housing is built in sensitive areas in 2026.	DCP	
				OPNG	
	Objective 9: Ensure sustainable and equitable water systems through conservation, stormwater capture, recycled water, and healthy soils to secure local and reliable supplies, protect ecosystems, and support community resilience.	A	Reduce per capita potable water use from 133 gallons per capita per day by 25% by 2035.	LADWP	
		B	Source 70% of Los Angeles' water locally by 2035 and reach total stormwater capture capacity of 150,000 acre-feet per year (supporting water for approx 1.8 million Angelenos) by 2035 to help replenish groundwater and improve water quality.	LADWP	BOE
				LASAN	
		C	Increase the number of multi-benefit stormwater capture projects from 42 projects in 2018 to 100 by 2035, leveraging Measure W funding and prioritizing disadvantaged communities.	LADWP	BOE
				LASAN	

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
		D	Increase recycled water for beneficial use from 27% (Fiscal Year 2017–18 baseline) to 45% by 2040 and complete the PureWater Los Angeles plan in 2026 to improve water reliability, and support climate resilience.	LASAN	
				LADWP	
		E	Reduce municipal water use from the 2013 baseline by 30% by 2035 and maintain or improve reductions thereafter.	LADWP	BSS
					GSD
					LAWA
					POLA
					RAP
	Objective 10: Advance a zero-waste, circular economy by reducing trash, composting organics, and reusing materials to cut pollution, save resources, and reduce emissions.	A	Conduct a citywide waste characterization study by 2027; develop a circular economy plan by 2029 to identify and implement additional waste reduction.	LASAN	
		B	Reduce per capita solid waste generation by at least 15% by 2030 from approximately 19.8 pounds per person per day to 16.8 pounds per person per day, including phasing out of single-use plastics by 2032.	LASAN	
		C	Eliminate organic waste going to landfills by 2035.	LASAN	
Goal 3: LA Will Be a Thriving Green Economy with Opportunity for All	Objective 11: Create high-road green jobs and expand access to training and apprenticeships that provide stable careers, family-sustaining wages, and pathways into the green economy for all Angelenos as we move toward a climate-resilient future.	A	In 2026, launch a workforce development pilot program to train workers for high-road jobs focused on land restoration and climate adaptation techniques to conduct vegetation management in the Wildland-Urban Interface (WUI) around high fire risk zones.	LADWP	
		B	Adopt and implement departmental green workforce plans across the City by 2028 to align recruitment, hiring, and upskilling with the City's Climate Goals, prioritizing graduates of the City's green pathway programs, recently arrived immigrants, first-generation college students, people experiencing homelessness, justice-impacted communities, and other underrepresented populations.	Personnel	
		C	Train over 400 people annually in the City's career pathway programs in green sectors, prioritizing equity-focused training and apprenticeships.	BPW	Personnel
				EWDD	
				LADWP	
				LAWA	
		D	Increase green jobs to 165,000 by 2028, 220,000 by 2030, and 320,000 by 2035 through City programs, from a baseline of 118,000 in 2026.	BCA	LADWP
					LAWA
					POLA

Goals	Objectives	Targets/Actions		Lead Dept.	Supporting Depts
	Objective 12: Grow Los Angeles' green business sector by encouraging private investment, sustainable practices, and entrepreneurship that keep wealth and opportunity in our communities.	A	In 2026, launch program to provide upfront capital for building retrofits and other green infrastructure investments to increase the number of green infrastructure projects in the City.	LADWP	
		B	Integrate the City's Climate Budget process to align with City climate goals and greenhouse gas reduction strategies starting in Fiscal Year 26–27.	CAO	
		C	Through the Games Energy Council, maximize clean energy for Los Angeles Olympic & Paralympic Games venues by 2028.	LASAN	
Goal 4: LA Will Be a Global Model for Bold and Equitable Climate Leadership	Objective 13: Make the 2028 Games and other major events models of sustainability through ambitious goals for clean energy, water, transportation, waste, and heat protection to leave a lasting legacy of cleaner air, greener infrastructure, and healthier communities.	A	Through the Games Energy Council, purchase 100% renewable energy for Los Angeles Olympic & Paralympic Games venues by 2028.	LADWP	
		B	Ensure 100% of concession containers and foodware are reusable, recyclable, or compostable for the 2028 Olympic & Paralympic community events to advance Los Angeles' commitment to phase out single-use plastics.	LASAN	
		C	Reduce food waste at 2028 Olympic & Paralympic community events through edible food recovery, and expanding composting and recycling access.	LASAN	
		D	Host a Transit-First Games in 2028 by deploying zero-emission buses, expanding micro-mobility access, and enhancing active transportation routes to connect venues and events throughout the City—ensuring legacy transit upgrades in underserved neighborhoods.	DOT	
	Objective 14: Create a lasting climate legacy from mega-events by embedding sustainability, equity, and resilience practices into City policies, programs, and partnerships — ensuring that Los Angeles' role as host strengthens long-term climate leadership, community benefits, and global influence.	A	Integrate shade structures, new shade trees, hydration stations, misting fans, and other functional cooling strategies around Olympic & Paralympic venues and community events by 2028 to protect the health and safety of workers, volunteers, participants, and spectators from extreme heat.	BSS	DCP
					DOT
					EMD
					LADWP
					LASAN
					RAP
		B	Expand the existing City facilities zero waste ordinance for the 2028 Olympic & Paralympic Games to include all City-sponsored events.	LASAN
